If you mean the Euro, I *think* the sign is gonna be a C with a -
through it. Doesn't any other country use the ï¿½ for money (outside
Europe)

BTW - Britain (i.e. England, Scotland, Wales AND Ireland - who all use
some type of ï¿½) aren't getting the Euro straight away. Some "high up"
people don't want it, and some of the government do. I think we're gonna
vote eventually.

Or we'll have to use the $ sign! (I think they're calling it the Euro
dollar?)

1984. Re: EZ230 Problem

Newsgroup: comp.sys.atari.st
Date: 1998-11-02 00:00:00 UTC
From: cmassey@gate.net
Message-ID: <71jfse$9g4$1@news.gate.net>
Source record: 90744

Hi David,

What is confusing me is that I have an EZ130 that I use all the time
and it works well. No problems on my TT.

I have been told that I may have to see if Syquest has a PC SCSI as I
have the Mac and have been using an adaptor cable-50 pin Cetrontics to
25 pin.

Thanks for your reply.

On 1 Nov 1998 08:37:31 G, David Leaver wrote:

What program do you mean? CoMa ?
Works nice on a falcon. Milan i don't know. No chance to
check this out. Ask people in maus.computer.atari.software ?

CoMa is installed here on one falcon. The falcon comes up if
the phone rings (hardware phone switch!) after boot up
CoMa run as .ACC, hook up and listen the line.

CoMa received FAX, DATA (Modem) or VOICE-Calls..
Put them all to your hard drive.

For voice calls you need a voice modem!
Same with fax..
ZyXEL, ELSA and some other modems works fine.

> Minix compatible without formatting the whole drive?

You never have to format a drive to change a partition format. You
wouldn't even have to do this if you wanted to connect a drive that was
connected to a PC or Mac or whatever to an Atari or vice versa. In all
these cases creating new filesystems (partitioning) is all that is
required.
Formatting drives that don't have bad sectors is a waste of time.

There is still one important advantage: If you want to share data with a
PC running under Windows you can do this with a FAT32 filesystem but not
with a Minix filesystem. If compatibility is not important the Minix
filesystem usually is a better choice, indeed.

wizard@tes-computers.com (Alan Bennett) inquired politely:

W > I need a Video cable to hook my Atari 1040St to a VGA monitor.
W > Does anyone know where a cable company is that may make this?

I doubt it. You'll probably have to build it yourself. I salvaged a cable from a dead sc1224 and am planning to build a vga switch box out of it and some other old dead parts to connect to this old NEC3d monitor. I haven't checked, but I hope the cable contains the 'mono detect' line.

But finding another old dead sc1224 should be easy - I think they are dropping like flies these days. The other end could be stolen from a pc video card, or is available from any parts store.

First of all, your software doesn't seem to be line-wrapping like it should.

Maybe you should get STinG, STiK is pretty outdated nowadays and didn't actually support PPP. Maybe concentric doesn't really support SLIP.

Nick

> local phone company)?

Simple answer is ... yes, but there are complications <g> The main one is that there are a variety of standards for the Caller ID data, and most modems support only one of these (although chips that can cope with most standards are available). Most modems support the American Bellcore standard, which is used by very few telephone companies in Europe. However, a handful support one of the ETSI standards that different European companies use. Here in the UK, British Telecom use one standard, some cable companies use the Bellcore standard, and other cable co's use another variation on the ETSI standard.

Only Pace, Hayes, and possibly Aztech support the BT standard, which is what most people here have on their lines. But, if your hardware suports it, it works fine - I've written a little FAQ about it at http://www.cloud9.u-net.com/callerid.htm where I've also got links to software (I welcome news of any Atari software, I don't know of any but there must be some somewhere.)

As far as what's been referred to as 'malicious call rejection', the automatic refusal of calls made with Caller ID ='WITHHELD', this is known as Automatic Call Rejection, ACR. You can do this by computer, but under the Telecommunications Data Protection Directive, Brussels has made all telephone companies in the EC that offer Caller ID, offer ACR as well by 24th October 1998. Here in the UK, most telephhone companies have complied, even though it hasn't quite made it into national law - BT is a notable exception. I imagine the situation is similar in Holland. 1478 is the standard code for switching it on, but some companies use *227# (*A-C-R#), or *65.

Alastair

From: lvzon@bio.vu.nl
Message-ID: <71kbc7sfm1@feresa.bio.vu.nl>
Source record: 90765

Stichting ST (atarist@xs4all.nl) wrote:

: Yes, is possible. The Falcon also has a nearly-modern PC printerport.

Well, at least four control lines of the "modern printer port" (which, on
the PC has the same lines as the old printer port)...

: When they went using the printerport for bi-directional they first
: took 4 handshake lines to transport data (nibble-mode).

Yes, this is the so called unidirectional SPP receive mode, which uses four
control-lines (of which the ST and Falcon have 1 and 2 resp.) to read data
one nibble at a time.

: Lateron they put some extra lines in and made the data come in/out
: trought the data-lines.

Bidirectional SPP mode. This is sort of supported on the ST and Falcon.
(as long as not too many other lines need to be used)

: So question: old scanner: ok but new scanner?

Most new hardware uses EPP or ECP transfer modes, which are implemented in
hardware on PC's which support them. At least EPP can be (partly)
emulated in software on the Falcon using some MFP interrupts, I don't know
about ECP. When one of the EJP (Extended Joystick Ports) on the Falcon (or
STe, in some cases) is used, all transfer modes should be possible, although
anything other than simple bidirectional SPP would need special drivers to
be written...

If people can't follow me: don't worry, I'm planning on writing a little
text on the subject of using PC hardware on the Atari parallel port Real
Soon Now (TM).

> find them?????????????

Boris - Very starange - Newsie 0.92 on my TT (MagiC 4.0) has been
working like a charm. The only problem I have encountered with MyMail
0.71 is that, for some reason, it no longer recognizes STiK, only STinG.
This occured when version 0.70 was released, 0.69 worked with both - at
least on my system.

Take a look at other programs that you are running, there may be a
conflict with Newsie and a TSR or *.CPX that you are loading at boot.

> Have you made any progress yet? Mail me if there's anything I can do...
> :-)

Yes I have made progress, and thanks for your help.

The progress I have made makes me look a bit daft! I eventually thought to try phoning Zetnet to ask if there was any problmem with my account (paid through a credit card monthly). They said that my account had been suspended because my credit card had expired and I hadn't replied to various emails. I don't use Zetnet for email so I never saw them.

Which explains why I can't connect!!! Sorry for the false alarums.

On the other hand, I'm taking the oportunity to rethink if I want to continue with Zetnet at all. I'm using Freeserve for everything except email (not least because I can't seem to set up the email account - every time it asks me for my password it comes back "not recognised" even thought it's the same one I log on with) and I'm very happy with it.

I joined Zetnet years ago because it was Atari friendly and cheap (I was only paying £7.50 a month for unlimited access). Now it's gone up to £10 a month, which compared to nothing for Freeserve is £120 more a year.

Part of me says I should stick with Zetnet, but an even stronger part wants to save £120 a year!

Andrew Harvey

2012. ST 1040

Newsgroup: comp.sys.atari.st
Date: 1998-11-02 00:00:00 UTC
From: "drs. P.L. de Wit" <pdewit@iae.nl>

Source record: 90772

On a streetcorner i found a Atari 1040 ST computer with mouse and
joysticks,
but without a monitor, without system- or application-software, and without
manuals.

Who can give me some informatoin about where in Holland (Eindhoven) or on
the internet i cann find:
- the type and/or spec's of de monitor which is needed;
- the cables that are needed
- the system-software
- applicationsoftware or game's
- manuals or information for the user

Please send your answer to:

pdewit@iae.nl

thank you...

2013. Falcon RAM board too high

Newsgroup: comp.sys.atari.st
Date: 1998-11-02 00:00:00 UTC
From: atarist@xs4all.nl
Message-ID: <71l07lqeg1@news2.xs4all.nl>
Source record: 90773

Many people have managed to get the RAM-boards for the Falcon running
with 4x4 Mb (14 Mb Atari-wise) SIMM's.
But there is a complaint:>

drawback it has seems to be that I cannot fit the casing back on, the
>keyboard rests directly on the RAM chips which is not so good. Is it
>supposed to be so that you cannot use them properly in a standard
>Falcon casing?

When the card was made, there were SIMM's around for notebooks that
had 'low profile' as extra.
A few mm. less high.

The way I do it nowadays is: see that the metal plate has hole enough
for the simms and glue some cork (from a wine-bottle) on top of metal
shielding. Then the pressure from the keybord on the simms is away.
Next problem: casing does not fit with screws.
Take some longer Parker-screws. You get a few mm. space between top
and bottom part. No problem: extra air is OK.
Next problem: the hole for the diskdrive does not fit. Take some
plastic out. Ways to do that: filing (hard work), sawing (less
work), melting (poisenous fumes) and cutting (very dangerous for your
bodyparts).

Met vriendelijke groet,
Ronald van der Kamp

Boris,

there must be something wrong with your setup. I have been calling Newsie
"a screwball" but that was nothing compared to what you're experiencing.

MyMail .71????????? How come I got stuck with .70? Didn't see any msg
about a newer version either? Anyways, .70 works pretty decent here.

Well, you mite try Okami (up to v.1.35B) but it wouldn't surprise me when
that one creates problems with you too :-)))))) I'd check my set-up, Boris!
And turn Newsies logging to minimum!!!!!!

You'd be better off getting one of the better designed SIMM boards for the
Falcon, such as the ActionSoft SIMM board, for example, which uses a single
in-line 72pin SIMM and fits in exactly the same space as Atari's original
SIMM board; and thus requires NO internal modifications to the Falcon030.
There is a simple jumper on the board which sets it to accept either a 4MB
or 16MB SIMM (which is designated as a 4MEG x 32 SIMM).

>
> JoNk
>

JoNk,

Try moving the monitor further away from the computer and see if the problem diminshes. It sounds like you're picking up RF interference. Does your Falcon have all its internal metal RF shielding properly installed and internal cabling properly routed, with data cables separated from power cables?

You might also check to make certain your monitor cable isn't bad or if you have a weak connection or loose pin on the monitor port. Also check the Falcon's power supply to make certain its putting out a full 5v/12v under load (when drives are active). A weak power supply could cause the problems you're encountering.

If you should need a replacement power supply, I'm pretty certain I still have a new Falcon power supply in the parts department.

Hi friends I wanted to do this long ago and it is finally here.
This project enhables the ST to use a SVGA Monitor and the ST Monitor.
Your SVGA must be able to handle the Frequencies of the ST video output.

This design was given to me by a Tech friend and I did the drawings with
Page Stream and used the IMG printer driver.
The Image is clear at 200 dpi
have fun and let me know how it works for you :)

I actually had great success with a Syquest 270 on my CaTTamaran TT.
Worked like a champ. Didn't work worth a damn on an '040 Mac, though.
Lost a whole disc (which backed up the important stuff) once. Got a free
cart, but the data was gone.

> Either way, my advice is to insist on a new replacement, I know of people

Hi William,

I have had what I believes to be the answer to my problem. I bought a Mac SCSI and should have bought a PC SCSI. I have to call Syquest and see if I can make a swap. I called the dealer I bought it from and they have no listing of a EZ230 PC SCSI but that may not mean anything.

Thank you for your reply.

Charlie

Okay, its that time again! (more of that thunderous drum roll, please!)

Our lucky winners are:

1) Centurion (James Krych): A 6 month/3 volume subs. to Atari Computing!

2) Bill F (Bill Freeman): An issue of ST-Plus Fanzine!

3) Gunner (Mike Harvey): An issue of ST-Plus Fanzine!

4) Fujiman (Rory McMahon): An issue of ST-Plus Fanzine!

5) Sky Devil (Cledith Girard): An issue of ST-Plus Fanzine!

6) Dennis McGuire (same): A fully populated Falcon RamGizmo memory board!

Thats it for this month. Congratulations to all our lucky winners. Don't forget, you too could be a winner if you just call our BBS at least once each month! Good luck to all our callers -next- month...! ;-)

PS All prizes will be shipped out by the end of the week...

Hi,

how can I use a timeserver? I've seen this one in CAB's config, nowhere
else, but what's the use for it?
I'm thinking it could be syncing one's systemclock to some standardized
time signal, but IS it really like that?
If so, how can it be used? Special software needed?

Questions, questions... will it never end?

PS: don't give me that "We can help you, join the Portfolio club!" stuff...

Kevin, I've been all thru' the docs again, looked into all the CPXes, Default.cfg and Dial.scr and the settings in the Dialers panel, but there's just absolutely nothing on it...
I tried adding NNTP_HOST = ntp.demon.nl (that's what my ISP is using) but it was a wild guess... I recall somewhere it's an NNTP server, or is it NTP server? Anyway, this line didn't do a thing. Added it after my HTTP-proxy lines.

BTW, found another thing: I reset my time-difference in the CPX to -60 min last weekend, now I checked the config files and it was still at -120 so I changed that one too.

So if someone can direct me to the right track, I'd be gratefull...

I'm going to check this out with my cordless mouse too. After a cleaning, I can still not go up-right diagonal. Up, and right, work fine, but not up-right. Strange.

I don't think this is the problem cause I have disconnected everything from the computer and it still happens, I don't have any TV's or other monitors nearby either.

2062. WTB: Cubase or Notator

Newsgroup: comp.sys.atari.st
Date: 1998-11-03 00:00:00 UTC
From: Aaron Christopher Finney <A_Finney@wfi-inc.com>
Message-ID: <363FA1EC.C536F699@wfi-inc.com>
Source record: 90661

I just got my first 1040STF since 1989 up and running and pulled out my old music data disks. Quite a find for me, except that in the interim 9 years I seem to have lost my Cubase dongle/docs/disks and most of my other disks are giving me data errors, including my Notator disks.

I'd like to buy either one, preferably Cubase 1.5/2.0 with dongle or an older version of Notator.

My 1040 is stock, with 1 meg of ram. From what I've seen lurking about, any newer versions of the above software needs more power...

Oh yeah, I've tried Sweet16 and I don't like it much...I'd just as soon use Performer on my Mac. I have it running right now, but only because of a lack of other options (no offense to the designer).

Thanks,

Aaron

My son has the TV for his Playstation next to the monitor and this
sounds like the effects that we get if you use the 2 at the same time
which we don't as it's a real headache generator.

>> >Falcon casing?
>>

None of the metal casing fits after that ram-card installation. About the
low-profile ram, IIRC, mine is just about 12-13mm high, but the casing still
can't fit.

Anyway, I just stick a piece of cardboard on the back of the keyboard, around
the area where the ram touches it. This to stop any short-circuits. I think
the keyboard is supported by some extrusion around the side so it is not
supported entirely by the rams. I am need to take a 2nd look at that.

But whatever, I am using 14mb now :-)

Rgds
William

Your mouse has moved. Windows NT must be restarted for the
change to take effect. Reboot now? [OK]

>Thanks for your reply.
>

Charlie,

I find the above very puzzling. As far as I know, Syquest does not produce SCSI separate models for the MAC and PC. Mine came with instructions for installation on both brands. The cartridges come Macintosh formatted and PC formatted and Syquest usually supply the Mac version with a SCSI model on the assumption that a PC buyer would be buying the printer port model.

I have used my ezFlyer with a SCSI equipped PC without problems.

Termination problems can be weird. I don't know what form of termination the EZ130 has, but the fact that is works does not imply that the EZ230 will work in similar circumstances, if your terminations are incorrect.

I'm not going to make a very technical response, but the VFAT option
in MiNT 1.15 has worked flawless on my EZ135. As Jo says, I took an
EZ135 disk right from the Windoez 98 machine at work home, and it
performed without errors the last six weeks. My experience with MiNT
partitions hasn't been all that favorable. The disk is also readable
on the Mac, without having to use MagiC Mac to transfer my TOS files
over to the Mac now.
I am almost to the point of enabling the VFAT option on a hard disk
(but not quite yet:).

It (the EZ) has my Newsie work folder and CAB cache folder on it, and
it gets hammered pretty good. Not one Newsie error at all (following
the golden Newsie rule of not messing with Newsie files while it's
active:). It seems to perform quite well as far as speed, but I wish
that Kobold didn't have to access it in GEMDOS mode (V3.5).

My advice is to stay with Appline and add StartMeUp to it - MultiStrip looks nice but doesn't have nearly the amount of functionality that the first two utilities have.

Team SMU with the SMU setup utility from my web page to take the tears away from configuring the StartMeUp config file, please note that it does not seem to be compatible with Freedom.

Hi,

finally I got my Mega ST1 (TOS V1.02) + Megafile 60 running.

Now I would like to connect it to my moms YAMAHA PSR 250 (or 210 don't know exactly, but it has a MIDI interface for sure), but do not have any software for that.

Anybody knows good software for my old combination of ATARI parts? I would like to be able to record songs from that keyboard and arrange them on the computer, use different tracks and mix it afterwards and all this stuff. Ideal would be if the computer would even be able to print a score...

Do I want too much or does something like that actually exist as public domain, freeware or shareware??? Unfortunately I am not an expert, so I would appreciate any help concerning this topic.

Thanks in advance,

Marko

P.S.: Does the SM144 monitor work also with 70Hz like the SM124?

Hello,

I think I can help you, as I run the Portfolio Club in the U.K. We have over
80 hardware and 600 software items in stock, we also buy and repair
Portfolio's. If you would like a copy of my clubs latest eight page price
list as well as details about the club, please send a S.A.E (Stamped
Addressed Envelope) A5 size (approx 160mm * 230mm) or larger to:

Portfolio Club (U.K)

2083. Trying to connect a CD to a MegaST4

Newsgroup: comp.sys.atari.st
Date: 1998-11-03 00:00:00 UTC
From: belthasar@scbbs.bungi.com.nospam
Message-ID: <910097258.1@scbbs.bungi.com.NOSPAM>
Source record: 90720

---------- b e g i n e x t r a c t e d m e s s a g e ----------
I am trying to connect an IBM Eternal Enhanced CD II to a Supra Hard disk
controller (with a 49MB Seagate 157N SCSI drive with termination inside the
case). The CD-ROM is connected to the 25-pin connector on the back of the
Supra (the 25-pin connector goes onto a 25-pin header on the controller).
This goes into one of the 50-pin connectors on the back of the CD drive, the
other 50-pin has a SCSI terminator. The HD is ID0, the CD is ID1. I am
trying to use MetaDOS 2.7.

MetaDOS installs, but says illegal disk change whenever I goto use it. The
ISO9660 driver also reports DEVICE NOT RESPONDING.

OK, the CD needs parity or something, installed a Wangtek 5525ES tape drive in
the case as ID2. Installed tape software, and the tape software couldn't find
the tape drive....However, when I turned the Supra on with a tape in the
drive, the drive initalized meaning it is seeing the controller.

My question is, can I use the devices like this or do I have to get a

50-centronics/50-header/50-centronics cable for the controller board and
connect everything that way?

Help me please!

Also, does anyone have a copy of the Supradrive Utilities disk that they could
zip up into a file and e-mail attach to me? My disk went bad and the boot
sector on the harddisk went corrupt trying to install the CIHD(?) driver.

2084. Falcon IDE replacement. Thanx!

Newsgroup: comp.sys.atari.st
Date: 1998-11-03 00:00:00 UTC
From: Jonas Klereborn <klere@physto.se>
Message-ID: <363F00B9.D6B1FB52@physto.se>
Source record: 90721

Thanx for all Your help.

I ended up getting a Fujitsu 3.2GB 2,5". It works just fine. No problem
att all.
It's half the size of the original 63 MB drive!

The reasons I got a 2.5" instead of a 3.5":

*The fan on the AB040 takes a little too much space in the Mk-X case so
the 3.5" mounting holes are not avilable. => to install 3.5" one needs
to drill new holes.

*The 2.5" -> 3.5" adapter was hard to get. (but possible)

*2.5" less power consumtion and less heat than a 3.5"

*Since the 2.5" drive is designed for laptops it is a little more chock
resistent than an ordinary 3.5". Good for carrying your Atari to
different places.

And because I got the drive for a reduced price it was not that
expensive either.

/Jonas

2085. Re: IEEE488 and Atari

Newsgroup: comp.sys.atari.st
Date: 1998-11-03 00:00:00 UTC
From: Steve Rollinson <rollinso@infobahn.com.au>
Message-ID: <363F0518.28752342@infobahn.com.au>
Source record: 90722

I saw a circuit for an IEEE488 interface a few years ago but I don't know where it is now. I did find a web page that had the specification for the bus at http://ourworld.compuserve.com/homepages/acea/hs_gpib.htm

Basically it is byte serial, bit parallel with handshake so an interface should be reasonably easy to design as long as the specification for the timing could be met. The ST serial interface is a bit slow in its native state, so the printer port would probably be your best bet. I designed something similar once, but that was about 13 years ago and I'm a bit rusty now.

I sent a similar request to Steinberg several times and got no reply.
I'm afraid they don't want our money any more :(

In the end I bought a second hand STe and got Cubase with it, dongle
manual and all.

Hello,

I think I can help you, as I run the Portfolio Club in the U.K. We have over 80 hardware and 600 software items in stock, we also buy and repair Portfolio's. If you would like a copy of my clubs latest eight page price list as well as details about the club, please send a S.A.E (Stamped Addressed Envelope) A5 size (approx 160mm * 230mm) or larger to:

Portfolio Club (U.K)
16 Cedars Road
MORDEN
Surrey
SM4 5AB
U.K, England

Or leave a message on our clubs answermachine, or send a fax:
Telephone & Fax(Home) +44 (0)181-286-8990

E-mail:paulfinch@x-stream.co.uk

Hope the above helps!

Paul

We MUST keep the Atari Portfolio Alive!

P.S. Visit our clubs stand at the AMP 98 Computer & Electronics Show (including the Atari Show) on 14th November, 1998 at Bingley Hall, Staffordshire Showground, Weston Road, Stafford, England. Between 10-4, only costs £3.00p admission. Lots of bargains to be found!

Roger, what do SMU+Appline offer over Multistrip? You just made me
curious, although I am running Freedom too and am not giving up that one
<g>

I installed Multistrip a little while ago, when I was looking for Appline
and found Multistrip instead. It does nice things, looks good, supports
drag & drop (drag a file on the QED strip and it gets loaded) and all apps
in (Thing) desktop groups can be started. You could delete all the group
icons on the desktop, although I find it easier to open the group and
select the app... especially because of the "simulated left-click" by a
right-click. Gives you access to all CPX-es, ACC's etc.

2092. Help for a beginner please.

Newsgroup: comp.sys.atari.st
Date: 1998-11-03 00:00:00 UTC
From: Andy Haslam <andy@innovnor.demon.co.uk>
Message-ID: <910101157.21227.0.nnrp-09.9e986529@news.demon.co.uk>
Source record: 90729

I own an Atari 520 ST which I have just found in my loft after about 10 Years.

Is it possible to download programs (Games) from the net onto my PC ?

Then somehow transfer the games onto Atari format diskettes, such that my kids can play games ont the Atari.

I have seen ROM codes that will work with PC emulators, but my issue is how to get the games to run on the original 520ST hardware.

Any help much appreciated.

Andy Haslam

```
: Hi!
: Does anyone know of an IEEE488 style interface for the ST family? Maybe
: even a generic parallel or serial to IEEE converter?
: Regards, Uwe Roeger

The following was still sitting around in my accounts, and it may finally
have come in handy. As you can see from the posting date, the info is
about 2.5 years old, but the company may still be in business.

Sounds a lot like Cubase Score. Unfortunately, it's commercial, and
discontinued. The only source is 2nd hand, and pirate stuff is not an
option because of the hardware dongle.

> Do I want too much or does something like that actually exist as

Try Sweet16 from Roni Software:
http://home1.swipnet.se/~w-11396/download.htm

>
> P.S.: Does the SM144 monitor work also with 70Hz like the SM124?

Yes, it's just a 14" version of the SM124.

Dear Mr. Finch: is it absolutely necessary to:

1. Post this message 10 times in a row?

2. Quote complete articles, where the answer is not even related to the
quoted text?

I think this is an utter and complete waste of bandwidth...

If you want readers to focus onto your group, something more usefull mite
help. Just a suggestion...

Is this absoultely neccesary?

I have found a lot of messages with this crap info on the end, even if the message is different.
If you are going to advertise, do it in the proper channels and not like this. It's irritating, it sucks, and people do not like it.

I know that you can use those Waveblaster daughterboards like the Yamaha DB50XG, since the waveblaster connector signals are mainly MIDI in/out, line out and power supply. The DB50XG has some very good sounds too.

But the sounds are pretty crappy on most soundcards. The AWE64 ones are particularly bad, and the old SB16 are no better than the ST's Yamaha chip. You can get one of the little cheap Akai GM expander or the Roland/Yamaha ones, which are especially designed for use with computers (no keyboard, buttons or display)

It's not *that* bad, the AWE-cards has pretty good (but not great)
MIDI, and the SB16 is OK too. The problem with SB-cards is their
incredibly noisy line-inputs/outputs, which makes them unusable for
anything else than playing games.

> Roland/Yamaha ones, which are especially designed for use with computers
> (no keyboard, buttons or display)

If you're a bit handy with a soldering iron then it's much cheaper to
convert a Waveblaster-card (www.atari.nvg.ntnu.no/db50xg/). I have a
Yamaha DB50XG in my Falcon and the sound is incredible :-)

Wanted to buy:

Atari MEGA ST2 or ST4. It must be in mint condition and have box. I'm looking for one as a collector so I'm trying to find the nicest one possible. I don't need anything else, just the CPU (keyboard & mouse) in original box. if you have a color monitor (SC1224) that would be great too. Please let me know if you have such a machine for sale. Thanks!

- matt

Hi! I recenlty got a good deal (I hope) with 2 Ataris. One is supposed to be an 1040STE and the other is a MEGA STE4. Now, upon careful examination of the 1040, i noticed that the RF port was blocked by a white board. This made me suspicious as all STE have a TV port. The next weird thing is that under desktop info, it gives me 1985... something is wrong here...Maybe they just switched the top sticker to STE? Is there a program or a way to find out what model I realy have? How can i find out if it even has 1 meg of memory?

How about the Mega STE?

Any help will be much apreciated. Please email me as my news server doesnt always get updated with all the messages.

Thank you!

Kill it! :-) 'kill <pid>' (where <pid> is the pid of pppd) will shut
down the connection and restore your MiNTnet-setup to normal. If
you're using a multitasking AES (N.AES, Geneva or MultiTOS) you can
also use Connexion (www-atari.nvg.ntnu.no/software/).

J>Also when the hard drive is running the lines move. I have unhooked
J>all devices and tried with only the Falcon and the monitor and it
J>didn't help.

Hi Jonk,

I seem to recall a similar problem that turned out to be a bad connection with my ram board/SIMM-chip. Try wiggling that around a bit, making sure it's well seated (or that the SIMM-chip is well seated in the board). And I suppose it might not hurt to take a look at any other chips that might have worked themselves loose... ARE there any others on the Falcon, or are they all soldered to the board? Anyway, it can't hurt to check them out.

Good luck,

Clayton Murray

Source record: 90565

There is a program called sysinfo that can be found at almost any
Atari FTP site. The 1040 STe came with TOS 1.06, or 1.62. It also
has stereo RCA connectors for sound and two enhanced joystick ports on
the left side of the keyboard.

The Mega STe should have TOS 2.05 or 2.06. The ST and STe have the
same top half of the case, so someone may have put the wrong top on.
The Mega STe is very easily identified by its "wedding cake" design.
The Mega ST had a square case.

B.P.

I remember a few years back there was a lady D.A. Brumleve who made a
series of programs for kids. They were highly regarded at the time.
She made a DTP and a paint program among others.

Besides games, if you can find these programs buy them for the kids.
Experience learned with the Atari GUI can easily be transferred to any
other GUI.

Check out the archives at UMICH there are a lot of PD games there.

B.P.

well, from the experience that both Ken MacDonald and I have had
with our RAM Gizmos, there was no problem at all fitting it inside - in
fact it turned out to be a complete no-brainer (though I did take it up
to my brother's shop just to be on the safe side ;)) In fact Mike
commented that there was quite a bit of room inside the Falcon for a
SIMM RAM upgrade.

>didn't help.

I had similar problems and it turned out to be a weak power supply.
Before it went out completely, I was not only have problems with the
monitor display, but I was having problems playing sounds, random
crashes in general, the floppy drive stopped working, and it even
killed two internal IDE drives. I recommend you replace it before
yours gets that bad. I recommend Best Electronics for a replacement.

2136. [Fwd: FS: Falcon/MIDI/Audio recording system, complete]

Newsgroup: comp.sys.atari.st
Date: 1998-11-04 00:00:00 UTC
From: Particle Salad <psalad@earthlink.net>
Message-ID: <3640FD3F.EC3BA951@earthlink.net>
Source record: 90573
Cross-posted to: rec.music.makers.marketplace,ba.music,comp.sys.atari.st

What, doesn't anyone want to buy this system!?! It's pretty
darned cool, if I do say so myself..

Anyway, I've yet to receive any serious offers, so if you'd like
it, let me know.

-Atari Falcon, tos 4.04, 14 megs RAM, 0hd, clock and audio mods
done
(all/most original docs, box, mouse, etc).
-Steinberg Cubase Audio Falcon 2.06 software with all manuals,
dongle, etc
-Steinberg Studio Module, Cue Tracks, Style Tracks software
bundle
-SoundPool ADAT interface, 8 inputs/outputs on lightpipe
-SoundPool mixermaps for Korg 168RC digital mixer
-Steinberg (SoundPool) SPDIF interface, upgraded to 20 bit
capability
-Steinberg ST-MIDI3 1 input/3 output MIDI expander for the Falcon

-Screenblaster 2 software/hardware
-NVDI 3.x
-Diamond Back, Diamond Edge software
-HDDriver 5.x
-SVGA monitor adapter

More? Whatever Falcon/Atari stuff I have otherwise..

I will include an iso9660 (dos) CDR disk with the setup info on
my C:
drive,
so even though no hard disk is included, you could easily (and
cheaply) buy a
SCSI drive and load my setup to get up and running immediately.

I would like to sell this entire system as a package, and will
accept a
reasonable offer. I am VERY realistic as to the real world value
of this
system (even though I probably sunk $3.5k into it originally..
money
well-spent, as I got quite a bit of use out of it).

Email me if you're interested...

-Mark

There are a variety of places that sell commercial games, like
www.systemsfortomorrow.com. Since you have a PC, I'd recommend buying the
Susy B 2 CD set. For about $25 you have over a thousand shareware Atari
programs!

The EZ flyer is identical for either the PC or the MAC. You may
reformat the Mac cartridge that comes with the "MAC" version and
you'll be fine.

I have never changed the termination on my internal TT harddrive and
have never experienced any data problems as David has described. The
external unit works perfectly when it's hooked up--the internal works

fine whether the flyer is there or not. Data errors may be more due to a faulty cable. Many of the cables with the EZ series had problems when used on the Atari.

Only the latest version of CAB (2.7) uses "cookies". SSL needs to be a part of the commumication interface (either CAB.OVL by Dan Ackerman or the *.OVL that comes with PPP connect - part of the CAB package from ASH). AFAIK it has not been implemented at this time.

2145. Gemulator and WordPerfect

Newsgroup: comp.sys.atari.st
Date: 1998-11-04 00:00:00 UTC
From: rbovet@iname.com
Message-ID: <71ooea$k2u$1@nnrp1.dejanews.com>
Source record: 90670

Is anyone else successfully using WordPerfect with Gemulator 98? I know WP is pretty ancient, but on a real ST it works pretty nicely. Anyhow, I've got Gemulator running and can bring up WP on it, but the bottom line of the screen always gets cut off. I've tried 2 different graphics cards on my PC and various combinations of settings with no success.

Has anyone else seen anything similar? It just acts as if the calculation for how many lines need to be displayed on the PC is off by a few lines at the bottom.

I sent email to info@emulators.com but haven't gotten a reply in several weeks.

Thanks for any help!!!

Ray

I have no idea how to set it up, but here is some SSL information for
CAB OVL.

This is a binary of the MiNTnet CAB OVL version 1.84 with SSL support enabled.
You can get the original distribution with source code from the author's site:
http://highlandsun.com/hyc/
This binary uses SSLeay version 0.8.0; you can get full info and source code
for SSLeay from http://psych.psy.uq.oz.au/~ftp/Crypto/.

This binary was built by Juhani Sivusalo <jasivu@na.netppl.fi> and can be
distributed freely throughout the world.

and

MiNTnet OVerLay version 1.84 for CAB

Introduction

This is a network interface module for Alexander Clauss's CAB web browser for
Atari STs. But you probably knew that already, or else you wouldn't have
bothered to retrieve these files... Anyway, this module uses the socket
library provided with Kay Roemer's MiNTnet network drivers for MiNT. Currently
the module fully supports the HTTP/1.1 protocol, as well as using SMTP for
sending outgoing email.

This module evolved from code written by Andrew Vesperman, but it's been
rewritten pretty heaviliy since he last touched it. It runs as a child process

of the main CAB process. I wrote it this way because I was frustrated by the original module's behavior, which didn't allow you to interrupt slow transactions. (I.e., the STOP button in CAB usually was ineffective.) Along the way, I cleaned up a lot of the original code, introduced my own brand of messiness, and generally extended it.

Features

You probably already know this too, but anyway:
Full support of HTTP/1.1 including
persistent/reusable connections
1.1 transfer encodings
both 1.0 and 1.1 cookies
basic authentication/authorization

Supports ftp/gopher/wais/news via http-based proxy
Netscape SSL (Secure Sockets Layer) for secure connections
(must be obtained outside the USA - you can get the
SSL library from http://psych.psy.uq.oz.au/~ftp/Crypto/.
You will need to copy the "certs" directory from the
library source code to /usr/local/ssl/certs on your
machine to get server verification.)

See the readme.hyc file for more up to date information.

Configuration

CAB-provided configuration

There's not a lot to it. For proxy setup, it uses the information provided in CAB's configuration menu. A proxy entry should be specified in URL format, e.g.
FTP proxy: http://my-proxy.mydomain.com:8080

The "No proxy" entry is a comma-separated list of host or domain names. (You can also use semicolons if you want.) A name may also optionally be followed by a colon and a port number, in case you want to filter by individual service type. A domain name is distinguished from host names with a leading '.'. e.g.

No proxy: some.host.com,.local.domain,secure.host:443

Specifying a domain name will bypass proxies for every host within that domain.

The SMTP server entry is used for sending outbound email. The NNTP server entry is currently unused, but would otherwise be used for news:xxx URLs.

CABOVL.CNF file

This plain text file should be stored in the same directory as the OVL itself. (The OVL should go in the same folder as CAB itself, unless you're using CAB 2.5 or newer. Then you should put it in the cab/modules folder, so that the AutoSurf and Download modules can also access it.) Here are the keywords for the config file:

gzip=C:\bin\gzip.ttp

Set this variable to the GEMDOS path to your gzip program. When set, the OVL will include a line in its requests that tells the server it can decompress files on the fly. If the server is configured to take advantage of this feature, then you can experience some speedup in your transfers. The OVL will spawn a copy of gzip to decompress the incoming data before writing it into CAB's cache.

[1998-02-13 note: this does not appear to work as desired. Don't use the gzip option, it's no good. -- Howard]

cookies=reject

Set this variable to control the OVL's treatment of HTTP cookies. The default is "reject" which means that all cookies are silently ignored. You can also set it to "prompt" in which case you are prompted every time a server tries to send you a cookie. You can also choose "server" which will silently accept cookies intended for the same host that sent them; it will prompt if the cookie is set for a domain instead of a host. (It is illegal for a host to set a cookie that is intended for a different, unrelated host.) Finally, you can use "accept" which will silently accept all legal cookies. Illegal cookies are always rejected silently.

mailfrom=hyc@highlandsun.com

Set this to the email address you want to use in From headers for your outgoing email.

maxhosts=16

The OVL caches information about every host and every URL you access. This setting controls the maximum number of hosts that will be remembered.

maxnodes=32

This setting controls how many object paths will be remembered for a particular host in the info cache.

Environment

Setting the CMDEBUG environment variable before invoking CAB will cause the OVL to log its activity into a "cmdebug.log" file. This file will appear in the same directory as CAB (or the module, if the OVL is invoked by a module).

The OVL will use the gethostname call to get the name of the current machine. This name is only used on SMTP connections, in the initial "HELO" greeting.

That pretty much wraps up all there is to know about configuration.

Miscellaneous Information

The OVL does its best to eliminate redundant network transactions, caching as much relevant info in memory as possible. Note that the info cache is only kept in memory, nothing is ever saved to disk. So, when you exit CAB, it all goes away...

The info cache is based on a list of hosts. The host list is maintained in most-recently used order. Each entry in the list stores a hostname, up to 4 IP addresses for this host, a list of "domains" for this host, and a list of paths referenced on this host. Each path entry holds the pathname of the object, its size, modification time, MIME type, and Entity Tag. (The entity tag is a unique identifier for a URL, introduced in HTTP/1.1. It is used in Conditional Gets instead of or in addition to modification time, to determine if an object needs to be re-downloaded or not.) The MIME type describes the type of the object, e.g. "text/html" or "image/gif" or whatever...

CAB 1.5 uses all of this (except Entity Tags) via the get_url_info call. CAB 2.5 doesn't use this call any more, so in fact CAB 2.5 never knows the size or type of the URLs that it accesses. Instead it uses the get_url_if_modified call, which uses the modification time only.

The OVL still tracks the modification time if given by the server, and sets the timestamp on the cachefile appropriately. Due to the restriction in GEMDOS that timestamps can only be stored down to a 2-second resolution, the OVL adds 1 second to all odd-valued timestamps before storing them. This should allow the Get/If-Modified-Since directive to work more effectively.

A domain object holds a domain name and a list of paths which have additional cookie or authentication information. Any web server can set cookies that will apply to itself or any other host in its domain. Likewise, a server can demand authentication info, which will apply to any host or domain it specifies.

Any questions? Email me. mailto:hyc@highlandsun.com?subject=MiNTnetOVL

Sorry to fill the box.

[snip]

Hi Louis, and Kevin,

What you need is the STinG Time services suite by Ronald Andersson.
It's available at Peter Rottengatter's site, at:
http://www.stud.uni-hannover.de/~perot/cli-serv.dl-bay-e.html

Once you unpack this, you need to call T_BATCLK.APP from STinG's
LOGIN.BAT (including the path). Then there's some setup in STinG's
DEFAULT.CFG:

```
#TIME_ZONE - GMT = +0, BST = +60
#
TIME_ZONE = +0
# And the one below means that we add 1 hour during March 30 through Oct 25
TIME_SUMMER = 03.30.10.26
TIME_SERVER = time.demon.co.uk
```

And adjust settings to suit :-)

Louis, there may be an equivalent like time.demon.nl ? Or, the one I'd
recommend for Kevin is Zetnet's login server - apparently many/most
Unix machines run a time daemon:

```
TIME_SERVER = spodden.zetnet.co.uk
```

I found using time.demon.co.uk _did_ cause some delays sometimes, but
with this one above, it's never more than a couple of seconds, and
usually less :-)

>BTW, found another thing: I reset my time-difference in the CPX to -60 min
>last weekend, now I checked the config files and it was still at -120 so I
>changed that one too.

Err... which CPX is this?

>So if someone can direct me to the right track, I'd be gratefull...

>great deal. All is well now with a new cable.
>

I am sure that this is the problem. I screwed up and missed one test
that I should have done. I hooked the EZ230 to my TT SCSI port
directly with the cable provided by Syquest and the drive worked
perfectly! I can't believe I did this. It was right under my nose
and I kept trying with the same cable config....... :-(

I fought this same battle about 2 years ago and had forgotten. It's
hell to get old.... The rule is, when you have an ICD LINK, you MUST
keep the cables short.

On a good note, I called ICD today and Tom answered the phone and is
building me the proper adaptor-50 pin female Centronics to 25 pin
male.

You can reach Tom with his EMail address:

tom@icd.com

He also has a web site and all of his products are available there.

I might add that I used the ICD driver on the Syquest EZ230 and it
works perfectly with my TT030.

Thanks to all who tried to help me. BTW, I feel very badly that I may
have contributed to the financial problems at Syquest. They sure lost
money on my deal, having sent me a new drive when it probably was not
at fault. Their service has been fantastic. We'll miss them.

Strange indeed. So you can go to all directions except for up/right
diagonally? This requires some re-thinking. It's impossible, you know...
Do you have a visible Wintel machine in the up/right direction. This may
make your mouse scared :-)

> card in a box with a power supply or do they rely on commands other
> than midi
> Kevin

A standard PC soundcard uses various commands from the operating system,
so it can't be used directly. I guess it could be possible to write a
program that produces these commands and drives a card with these,
through a suitable adapter. After all, it's only bits and pieces...
Any volunteers? Would not be an economical option, but crazy things have
been done before :-)

An easier approach: Get a 386 (or 486 if you are thinking of a newer
card; the new AWEs require at least a 90 MHZ Pentium, sorry) with basic
setup (a 40 Mb HD is enough for Win 3.1 and whatyouneed). These can be
had nearly for free these days. Install the card of your choice (as long
as it's ISA). Install a suitable MIDI program and make it autorunning on
start. Then you can remove the monitor and put the thing in a
well-ventilated cupboard. Use your -computer- to drive this setup via
MIDI...

A waveblaster card (an add-on for standard SB compatible to produce
wavetable sounds) can be fitted, as it is midi-only. See

You never have to format anything in order to use it for a different platform. There are no different formats of a hard disk drive or a cartridge. The only difference is on the filesystem level. Filesystems are created when partitioning a drive. In other words: If you want to use a cartridge or drive that was previously used on another platform with your Atari, simply partition it. There is absolutely no need for formatting except if you want to waste your time.

By all means, you are entitled to do what you like with your PC, but
isn't it a bit too complicated to run what is basically a DOS program on
an Atari emulator? I would suggest that you get a second hand WP 5.1 and
run that in DOS. It's the same actually as the Atari version, but has
many added features (which nobody hardly ever uses).
Before attempting to get into the Windows market, WP was number one in
word processing field (IMHO). Version 6 was crap and crashed all the
time, and was the start of WP's downfall. I believe you can get the
latest versions free with some cereals :-)

Hi Mish & Kevin,

first of, tks to Kev for the prompt sending of relevant stuff.

So, I put this T_BATCLK.APP into the appropriate folder in Sting's dir, changed the LOGIN.BAT accordingly, changed my DEFAULT.CFG to what it should be (we're on +60 mins to GMT and +120 mins in summertime), reset the system just in case and tried it with ntp.demon.nl (which according to the docs is Demon's time server over here).
Well the LOGIN.BAT line IS in the default.cfg but I don't see my clock change anywhere during a connection. And it IS off about half an hour rite now, so that's not the problem :-)
BTW Mish, it's the Sting Protocols CPX that has a time setting somewhere. That one was set last week to +60 mins, but Default.cfg must have the line changed separately, these two are not linked. Haven't checked this literally, but I "thought" my time settings were OK after changing the line in Sting Protocols, so I don't know whether or not the line in Default.cfg does have effect. The added lines for the time-server do NOT, at the moment :-)

I'll check this stuff on Peter's page for docs or something... Or maybe Peter himself might jump in for some explanation?

>So if someone can direct me to the right track, I'd be gratefull...

OK.

You need to use Dialer's LOGIN.BAT file to call a program which
gets/sets the time for you. You will need to check the box in
Config/Misc to get Dialer to do this.

There is a package of such programs on Peter R's 'clients' page, I use
T_BATCLK.APP. There are useful docs with these which tell you how the
various clients can be used.

You will need to set a TIME_SERVER URL in DEFAULT.CFG (for Sting). I
guess your ISP will have a local one although you can use any - try
spodden.zetnet.co.uk if you can't find anything else ATM.

On my set-up I use a slightly more complicated way.

LOGIN.BAT calls Gary Priest's SPAWNER. This sets-off parallel processes.
In my case I start the timer-client and then Newsie.

Hi again,

-SHAME ON YOU, LOUIS! mode on-

Ooooooooops, just completely forgot to tick the box "run LOGIN.BAT" in the Dialer's settings....

-SHAME ON YOU, LOUIS! mode off-

So did just that and it works flawlessly. BTW, I fetched the stuff from Peter's site and tried T_SETCLK.APP too, but that one made the stuff freeze totally... With T-BATCLK.APP no problems: 2 secs and the clock is set.

Tks for the tips...

Hi Roger,

well, EXACTLY! That's what I forgot in the first place :-)
Like I wrote, it works pretty OK, hardly any delay. Soon as my link is established I see the clock jump, next the box sits there for another 2 secs and I can go on. Guess I can remove the Tranx option in Semper now, since that one syncs with my Fido node and is always off by 30 secs to 2 minutes...

Learned something more this time!

Just kill it (it's ok, this is the proper method).

I have a tiny shell script for this purpose called "endppp" that looks
something like this:

```
kill `cat /etc/ppp/ppp0.pid`
```

In that case I would recommend getting a used MIDI Blaster by Creative Labs. It is basically a wavetable card in a box; MIDI in/thru, power switch and volume; nothing special, just General MIDI (which includes bells & whistles :-)). It has some extra instrument banks, but you need to use a suitable program to use these. The sound is OK, better than SB16, I guess it would be what you need. Didn't cost too much as new, a used one should be quite cheap.

2181. ICD Host Adapter Software Questions

Newsgroup: comp.sys.atari.st
Date: 1998-11-05 00:00:00 UTC
From: David Jackson <anderon@ix.netcom.com>
Message-ID: <71rk61$feh@dfw-ixnews10.ix.netcom.com>
Source record: 90586

I recently acquired an ICD AdSCSI Host Adapter, in great condition.
However, it didn't come with any software. Does anyone know if there are
some generic drivers for hooking up hard drives/CD-ROMs, or do I need to dig
around and find the specific drivers? (My first search proved futile).

Thanks...

>What is the most popular Email program for MagiC/Sting?

Hi Jake,

as Kev already suggested, you're using one rite now... Though I don't know whether or not it's the most popular one :-)

Furthermore, there is Okami, up to v. 1.35B freeware but it appears to become shareware. If you're looking for *features*, here's the one! Acts as a newsreader too.

Next one is MyMail, freeware too, up to v. 0.71 although I must have missed the announcement for 0.71 myself. Needs modern AES, like NAES or MagiC to get all the gizmo's nicely on the screen.

Another one appears to be Infitra, it was in test beta versions but should be commercial. Price said to be around 40-45 USD. (well, at least I mentioned it, didn't I?)

Katherine Ellis works on POPGem, up to v. 2.3 and freeware IIRC.

Of course there's ole' Antmail, but I think it's left alone (no more development?).

The one from ASH, ASH Emailer is commercial but needs I-Connect. (and it doesn't wrap lines correctly from the standard settings I gathered, therefore I don't like it).

So all in all, if you're looking for FEATURES, go Okami, if you want Gizmo's, try out Mymail and if you don't want a bunch of separate programs, stick with Newsie.
If you must spend dough, go for Infitra :-)

(Sorry Kath, don't have an argument for Popgem, but perhaps you have? It's just that I never worked with it...)

Oops, nearly forgot to mention Marathon, which comes with it's own TCP/IP stack but I tried to evaluate it under MagiC and it wouldn't run/fetch news/fetch webpages so there was nothing to evaluate really :-(... Hohum!

There are releases of ICD HD s/w which are in the Public Domain. You
could try Umich, perhaps.

However, you can use practically any driver with the ICD board (the
same applies to the majority of host adapters) so I would recommend
you go for something more up to date.

HDDriver is certainly the most comprehensive. It is commercial but a
demo can be obtained from Uwe's site.

CBHD (I use this) is PD. The latest release is 5.02.

As well as a driver/partitioner you will need a defragger - I would
recommend HP_OPT v2.7.

1985 sounds suspicious. An STE will have 2 extra joystick ports on the
left hand side, and stereo RCA jacks on the back, under the power
switch. Inside, memory will be in SIMM sockets.

STE TOS 1.06 or 1.62 should say something like "1985,86,87,89,90".

A program like sysinfo will tell you all you want to know about your
machine's specs. Download it from the quick FAQ, section 1.3.4

You can get a complete AHDI package from the Quick FAQ, but ICD's
drivers were freely distributed, since they only work with ICD hardware.
You can probably get them from most FTP sites.

Judging by your postings here you are being the same... grow up.

BTW, do you think that because you are posting from Deja News that no
one can find out you are an enta.net customer/staff member? All we
need to do is read the headers of your posting to find out the IP
address and who the block is assigned to.

So, any explanation of what caused your outburst.

Regards
Danny

Hello,

Note that Mr Paul Finch (Portfolio Club U.K) E-mail address has
changed from pfinch@mettav.demon.co.uk,
To: paulfinch@x-stream.co.uk
The telephone number stays at +44 (0) 181-286-8990 (answermachine)

Please pass this information on to one other person.

Also:

WHAT HAS HAPPENED TO THE TAVERN BBS?

Can anyone help me with the above, which is a London (England, U.K) based BBS.

I was logging onto them approx once a week when suddenly the number just
started to ring and ring but does not log on to the BBS. Yes, all my computer
equipment does work as that is how I got here!

I have even wrote to Mr Paul Baker (the Syops) but no reply!

HELP, does anyone know what has happened to 'The Tavern BBS'?

Paul

We MUST keep the Atari Portfolio Alive!

Apologies, but I completely lost my previous post and replies to this newsgroup on the following question, so I'm repeating it:

Is there a way of using a PC (via the serial port or whatever) and its harddrive as a filestore for the ST? I want to be able to run executables via this method. Is Ghostlink capable of providing this functionality? If anyone knows APE on the Atari 8-bit (well, it runs on the PC...), then they know what I'm looking for.

Thanks (again!) in advance,

Trystan

Bob Wakelin is the artist who illustrated nearly all the covers for Ocean software between 1983 and 1994. His work includes the covers for Rainbow Islands, Match Day 1 and 2, Parallax, Head over Heels, Parasol Stars, Chase H.Q., The New Zealand Story, Hyper Sports, Pang, Where Time Stood Still, Moon Alert, Operation Thunderbolt and Target Renegade.

Now he is selling the original one of a kind artwork for selected titles. Details (and about 30 box scans) can be found at:

http://retrogamer.merseyworld.com/wakelin.htm

An interview with Bob Wakelin can be found in the current issue of RETROGAMER fanzine (number 18).

Ghostlink can do what you want, but over a serial port it is slow. I do rememer reading that the author was going to do a parallel port version when he got some more info. I don't think it ever got done. (please tell me I'm wrong and where I can find it!!!)

No, SIGTERM is 9, 0 is SIGNULL and is only use to determine if <pid>
is alive. 'kill' use SIGTERM by default.

Nope. SIGTERM is 15. 9 is SIGKILL and should only be used to get rid of processes which have run mad, as this signal cannot be caught - the process therefore has no chance to do any cleanup, which is not what you want when killing the pppd.

SIGTERM (15) is the default for `kill', though.

Ciao

Thomas

Hi

Sounds like you have this is an STF, a STFM without the M (modulator).

I have just come across my first STF with a double sided internal disk
drive. I have come across double sided drives that look like single sided
ones in some STFM's but I didn't think they did them for the STF's.

So that standard looking single sided drive in early ST's maybe double
sided.

Anyway, I hope I've been of some help.

Now! I know many people have said this, but is there any need for swearing and general badness in this forum??

And as for the guy who started it, whoever you are, keep your remarks to yourself, and think twice before posting bad language to a newsgroup. As this guy said, kids can read newsgroups. Think.

And what has Toney greenwood done to you? He has done a lot of things for the Atari Scene, and I think he deserves respect, not abuse.

Er, we *are* talking computers here aren't we?

But I know what you mean. I wouldn't even entertain the idea of one
of those, those, Oh God, I can't even bring myself to type those two
letters, in my house.

->-- strads@tmisnet.com

Hi George. Had this very same problem when I first started with Mint. There are 2 ways that I know of:

1) From the mint command line, do a "ps" command. It will list pppd and a job number to go with it. Type "kill #", # being whatever job number is assigned to pppd. If that doesn't stop it, then try "kill -9 #". That one will nuke it dead. ;-)
2) Now, if you are using an AES/GUI (and I highly recommned N.aes/Thing) then go to Jo Even Skarsteins web page and d/l Connex. It is a graphical way to run pppd from your desktop. Even shows how long you are logged on. Very nice (and I hear he is working on a new version). ;-)

Hope this all helps! ;-)

you can start by upgrading to the newest version of NVDI, version
5, which includes among other things a whole whack of new printer
drivers, including the latest Epson, HP and Canon printers. That's what
I'll be doing before I go printer shopping for something that will
allow me to print photos - I'm currently looking at either the Epson
640 or the HP 693 (I've got an HP 540 currently, does text and cartoon
graphics beautifully, but doesn't really cut it for photos).

That's piracy. That's not kosher.

Now, while it's true that most of the companies that make some of this older software are no longer in business, and they certainly aren't going to get any serious revenue from these titles now, it's still piracy. Piracy is one of the _many_ issues that killed the ST.

I'm not taking a stand for or against piracy, but asking for assistance for piracy on a public newsgroup is in very bad taste.

There are some things that you should figure out for yourself.

Hi! I'm looking for some old Atari games and would like to trade newer PC games for them. I'd prefer original boxes, manuals, and disks of course, but am willing to trade for just disks or disks+manuals for a better exchange rate.

I have a huge list of PC software and PSX software to choose from, lots of it still in the shrinkwrap. I also have a lot of publishing & multimedia wares, and would be interested in trading those for programming tools & utils & books for the //e.

If you have some Atari software and are interested in potential trades, please let me know. Thanks!

Not to mention in french, 50 Euros sounds phonetically like 50 burps.

I agree, it's a silly name, a silly symbol (not a symbol actually, more
like a logo). Typographers are having a hell of a time designing new
character. It doesn't go well with serif fonts for example. Other thing
is that it's wider than a numeral character, which is wrong
typographically.

Oh well...

Source record: 90498

Hello,

Dans son message ï¿½ï¿½Calamus Printer driversï¿½ï¿½, Wayne Martz a ï¿½critï¿½:
ï¿½ï¿½Hi! I'm looking for Calamus SL98 printer drivers for the HP Desck jet
ï¿½ï¿½692c and the Epson Stylus 1520. Any suggestions? Thanks!

For the HP, I think the HP-850 drivers work fine in 300 * 300 (but not
in 600 * 600, it seems to give some 600 * 300...) and are much faster than
HP-550 ones, at least with HP-690c (so I think on 692 also...). If you do'nt
have them, you can download an archive on http://www.invers.de with all
printer drivers of the standard distribution (they are part of it).

For the Epson, you may try the "Epson Universal Printer Driver" - but
you must buy it. More details on http://www.invers.de, with the list of
supported printers if I remember correctly.
You can also try the epson drivers sold with SL, may be some of them
can print in basic modes of the 1520 ?

As a filestore, Ghostlink will work, for running programs, it will not.
The only way I know of is to use a Network File System (NFS) between the PC &
Atari.

I did this, & it does work, but there is a lot of setting up to do before it
produces anything worthwhile.

You will need to run MiNT on the atari + networking (You basically end up
installing the whole KGMD or KEMD setup).
Then you have to run NFS on the PC.

Is Ghostlink capable of providing this functionality? If

What about the old Computer Third Reich ST version.
It was pretty good for a conversion. The AI was poor at best. I remember
winning as Axis by withdrawing to the western front and surrounding the
invading Russian horde the turn after invasion of the Mudderland. Captured
75% of the Russian Army in 1 pocket.

To convert the images back to ST disks, you need a program called Makedisk.
it reads the images and writes an ST readable disk using a PC.
more info at:
http://www.fatal-design.com/makedisk/

loads of atari info at:

http://lgd.atari.org

Mish, I fetched 1.15 from Peter's site and haven't seen any T_BATCLK.APP
at all... maybe it wasn't decompressed from the archive, have to check
that one.
Anyway, with the accompanying docs plus other apps it was worth the D/L
time...

Now, it just MAY be that this message rolls in around 3 times... Changed a
line in O.INF about the timesettings and Newswatch wouldn't send the
postings OK. So I changed the line again and have to check this time.
Could be only this one is "accepted", could be NOW the other 2 will be too.
Apologies for that!

> one will nuke it dead. ;-)

Another quite convenient way: Use your desktop, open U:\proc\ and then
drag the file named pppd.<something> into the trashbin. Deleting files
in U:\proc\ (which represent the running processes) has the same effect
as sending SIGTERM to the corresponding process.

Of course, this is also possible from the commandline:

rm `/bin/ls /proc/pppd*`

(note the quotes are backquotes)

Ciao

2242. HD Floppy upgrades

Newsgroup: comp.sys.atari.st
Date: 1998-11-06 00:00:00 UTC
From: Martin-Eric Racine <q-funk@hal.fishpool.com>
Message-ID: <Pine.LNX.3.96.981106155717.11785B-100000@hal.fishpool.com>
Source record: 90507
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Because of the increasing difficulty in finding DD diskettes
(and HD can store more), I'm thinking of upgrading my Stacy.
However, I'm wondering how to move the cover plate and button
towards the new floppy drive. Any hints on Stacy HD upgrade?

***

Also, I have a defective SF314 (the drive itself seems to be
kaput) which I would like to upgrade to HD as well. Can the
SF314 circuit handle HD drives, or is that entirely dependant
upon the presence of an AJAX chip in the host computer?

***

A real personal choice question, but IMO it's Okami with support from POPwatch. Then add NEWSwatch and SPAWNER to complete the package. Makes retrieving/sending NEWS and MAIL completely automated under a multitasking OS.

This is definitely the feature packed way to go -- again, IMO.

Message-ID: <36430EC9.78BAE146@infobahn.com.au>
Source record: 90509

Well, you could be right, it's been a while since I used it. I do remember using it to set up drive
icons on the atari desktop which were links to my old 286 PC's hard disks - and using it, but I'm
pretty sure I can remember running something from there by double clicking a PRG file which existed
on the PC. Admittedly, I could be confusing it with something else. I can't even remember what
version it was.

PARCP is something that I've tried more recently and it is damn quick. I'm still setting up my Linux
box and I may use PARCP to transfer files for backup from the Atari. You definitely can't run stuff
accross the link though. If I end up using Parcp I'll definitely be supporting the author by sending
the required shareware registration fee (which isn't much).

Hi Thomas. Hmm...I had actually read about doing that in Current Notes
(a US based Atari publication-remember them? I, ahem, actually wrote for
them a couple of times) but the article was covering MultiTos, and the
reviewer (Eric March, I think?) said that it wasn't really recommended.
So its okay/safe to do it with Mint? Cool. Thanks! ;-)

Firstly, excuse me for this message being off topic.

You may or may not know about the CYberstrike.
http://www.ukgn.net/cyberstrike/ The purpose is for ALL UK net users to boycott using the internet on Sunday 13 December, 1998.

Visit the site, sign the petition, and campaign for free local calls! By supporting Cyberstrike, you will be hitting the telephone companys where it hurts; There Pockets.

People have had enough! Telephone calls are too expensive, and for that reason the internet is not used by many people. Save the UK Internet scene, campaign for fairer and cheaper call charges!

I apolosige for posting off topic :)

Simon Osborne

It's not recommended for GEM applications (though some (e.g. Thing)
install a handler for SIGTERM and exit gracefully), but for daemons like
pppd, it's almost always the recommended way, as it's not any different
from sending SIGTERM manually via kill or any other tool.

Ciao

You can use the header "Followup-to: " for this purpose :-)

ex.: Followup-to: comp.sys.atari.st.tech

(not all Atari softwares support this easily, Okami does)

look for PARCP (or is it PARPC?) you should be able to find a link to it
either from the UltimateTOS Software Index, or Hallvarts pages.
uses a slightly modified parallel cable.

I note that no-one mentioned that the STe had a blitter in it and that you can turn it on and off from the desktop. You'll find it under the menu easily enough, it says blitter and may or may not have a tick next to it :)

That's if you want to see if it's an STe :)

As for programs to tell you, There's GemBench, Speed Of Light that will.

AM.

I think therefore I AM.

>find them?????????????
>
Are you sure your TT is in great shape or that your setup is right? It's
surely very strange that you can't use Newsie or Mymail. Before I had my
Hades I tried these and some other mailers on my TT. Apart from Newsie
which did some strange but mostly unharm things on the HD I never
encounter any major problem.
Oasis 1.35 worked fine
Mymail worked fine (at least under Sting)
POPwatch/Newswatch/Okami works very great. I recommend you this trio.
Antmail worked just fine
Infiltra does its job
The inbuilt mailer of Wensuite worked.

>my sig, and there is a link to Okami from there.

Yes I fully endorse this viewpoint. The trio Popwatch/Newswatch/Okami is
the best one can find. I'm using this trio with much pleasure.
Popwatch/Newswatch are very easy to setup. Okami is more difficult to use
but once you get familiar with all the posibilities you'll find that it's
certainly worth the pain.
Although these programs are still under developement they are solid like a
rock which unfortunately can't be said of the other mailers around.
Sure Okami doesn't look so fancy like for instance Infiltra but it does
its job beatifull.

If you want something more fancy you may try Mymail. It's know to have
problems under Mintnet/gluestik but from what I've heard it works good
with Sting. You can find it on Erik Hï¿½ll's webpage:
http://www2.tripnet.se/~erikhall/programs/program.htm

> find them?????????????

I don't have much experience with MyMail and NEWSie (I've been using
NEWSie for news from time to time, but never with mail), but the best
mailer for Ataris must be pine for MiNT :-) Very stable, easy to use,
feature-packed... Mutt is also popular, and while it's a very good
mailer I still prefer pine.

The downside with pine and mutt is that you *need* a pretty
comprehensive MiNTOS-setup. MiNTOS is IMHO the best TOS-compatible OS
so I don't mind at all, but not everybody needs/want/likes MiNTOS...

I like GFA Basic better, because when you make a mistake (lets say you type in PRNT by mistake rather than PRINT it beeps and doesn't let you carry on until you change it)

But Hisoft is better for Gem and separate "librarys" you can have. (And you can use line numbers)

I have a Koala Pad and a ST (and TT). Is it
possible to connect the Koala Pad to these
computers? Are there any special drivers
that are out there?

Thanks for your help,
Chris

2276. TAF MonSTEr Flea Market July 11th

Newsgroup: comp.sys.atari.st
Date: 1998-11-06 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <3643d2c8.0@nemo.idirect.com>
Source record: 90541
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy,comp.sys.atari.8bit,alt.atari

WEDNSDAY, NOVEMBER 18, 1998 is the date for the Toronto
Atari Federation FLEA MARKET! The doors open to the
public at 7:00 PM and will remain open until 10:30 PM.

This is your chance to come to a bazaar of Atari related pre-owned
hardware and software where you may find that peripheral, application or
utility for your ST/Mega/TT/Falcon 16/32-bit computer system or your
XL/XE 8-bit classic computer system.

If you have original software or hardware that you no longer have any
use for, get yourself a half-table and try to sell it! Or find that
treasure that you have always wanted. Great deals should be in
abundance.

Half-Table's will be $5.00 or the Full-Table for $10.00 each.
Half-Table's are FREE to TAF MEMBERS. Admission is $2.00 per non-member
family but if you are selling and have taken a half-table or more,
admission is inc- luded. Admission for TAF members is, of course, Free.

The Flea Market will run from 7:00 PM to 10:30PM, with setup commencing
for sellors after 6:30 PM, and teardown after 10:30 PM. This should
allow enough time for as many people inside and outside Toronto to
attend the event.

As usual, piracy cannot and will not be condoned. You must be selling
original pre-owned software only. If anyone is caught selling pirated
software or stolen hardware, they will be dealt with severely!!

The TORONTO ATARI FEDERATION Flea Market will be held in the "Rose Room"
of the North York Memorial Community Hall on the Lower or Concourse
Level of the North York City Centre Library Building at 5110 Yonge
Street (next to Mel Lastman Square) at Parkhome Ave. Parkhome is 5
stoplights North of Hwy 401 running East off of Yonge

Source record: 90638

How compatable with regular UNIX are linux, mint, and NETBSD. I need to run special software for my business and can get it for UNIX and X-WINDOWS, Win95 and NT but not for TOS and there are no substitutes. netBSD looks rather simple to install, just three floppies. Linux needs the math co-processor which is hard to find and Mint confuses the hell out of me.

Thanx's

There is a "shareware " sequencer called Sweet 16 Lite.(from Roni
music) Just use ATARI MIDI SEQUENCERS as a word search on your browser
and you should find it. I mostly use Sweet 16 myself just to play back
midi files. It has some other nice features also.

>>
>>2.) Anyone have any hmnal or church-related midi
>>files? (oops-that should read hymnals)
>>

Again....use MIDI FILES as a word search, and some sites should come up
that you can explore to see if they have a Hymnal section.Download
them, put them on a 720k disc,Then load them into Sweet 16. You will
need some Midi modules to play them back that are connected to the
ST's midi ports however. It should be a General Midi Module as most
midi files are GM standard.Then the midi files should have no
problems playing back with the correct sounds.

The kill program I have, which I think came from KGMD, will accept the
signal name. For example I can type kill -KILL instead of kill -9. It's
much easier to remember this way.

It's approximately a C with a = through it; a bit more than a half
circle, and the lines go about half in the intersection.

> >People who can change fonts (not everyone can) should I think be OK
> >presuming someone has made the euro monatary sign :)

Note to possible programmers:
We just got some new Keytronic keyboards in the office, and they have
the Euro sign on them, on the E key (guess it's Alt Gr + e, haven't
tried this yet). So if you are planning anything, please keep the
standard!

> Or we'll have to use the $ sign! (I think they're calling it the Euro
> dollar?)

Not officially; it's just plain Euro. Just shows the idiocy and lack of
imagination from the ones who decide these things. Think if the dollar
was called "USA" or the sterling "Engla"... I heard that our friends in
Greece are particularly happy about the name, not totally unlike the
liquid by-product of a person :-/ (correct me if I'm wrong...)

Do you mean me? (g)

I couldn't get drag'n'drop to work here with Multistrip, however your
experience seems to be at variance - a common theme it seems.

>curious, although I am running Freedom too and am not giving up that one
><g>

No need to abandon Freedom, I just terminate it when I run the SMU setup
prog since it does not seem to be compatible with the doubleclick to
navigate to the file to install section.

2287. New Canadian Atari dealer update

Newsgroup: comp.sys.atari.st
Date: 1998-11-07 00:00:00 UTC
From: Bengy Collins <collins@bulli.com>
Message-ID: <3644DEB1.5AD10DAD@bulli.com>
Source record: 90394

Hello again,
well I've been in contact with a few atari dealers, and although I am still in the planning stages, this is what I know so far:
I will not carry any Titan products. Nemesis, Apex Media, etc. I would like to, but since they already have a N.american dealer (ATY computers?),,
I am in talks with MILAN and hope to carry the Milan computer.
-
What software you guys think I should carry? You as the customers will be the ones buying it (hopefully :-) so it should be up to you..
Papyrus? Centek products? (CTII..)
Cab/MagiC etc (I have yet to contact ASH, but it's my understand that I have to go through System Solutions?"
Registered Shareware?
As soon as I get going I will discuss being the Canadian distributor for Atari Computing magazine.
Thanks to the dozens of E-mails I have recieved supporting me, they really helped allot.
One E-mail suggested I carry the new Wizztronics computer, however one source told me that they had on their webpage a message stating that it has been canceled. When I visited thier site, the message was gone.. so I am uncertain about this..
Bye all,
PS I have set up on my magic page a small poll, asking if you think it's a good idea or not.. why not fill it out and show your support (or lack of it)

I was having the same problems myself - until my detective work
with my AUTO folder found success when I disabled WDialog. If you're
running that I'd suspect that is the culprit.

it's the new standard for 56K modem protocols as decided upon by
the commission responsible for modem standards, and replaces the X2
protocol (3Com/US Robotics) and KFlex (just about everybody else) that
were the two "standards" that were competing against each other.

If you're using a US Robotics with X2, I believe that 3Com is
offering a flash rom upgrade to allow you to upgrade your modem - you
might want to get in touch with them and find out what procedures/costs
are involved. OTOH, you could also try connecting for now at 33.6 and
see what happens.

A similar but opposite problem happened with the iMac soon after it
was launched - a number of users complained that they couldn't get on
their ISP of choice. It turned out that the v.90 modems in the iMac
couldn't connect at 56K because the ISPs in question didn't have v.90
up yet. I believe this problem has now been fixed. (you'll find a
synopsis of the problems - and Apple's initial advice, which was "just
sign up with Earthlink" - in the archives at http://www.macintouch.com).

Personally, when I was looking for a faster modem to replace my
14.4 I looked at the 56K option, but settled for the 33.6 - due to the
fact that you'll be lucky to consistently get download speeds anywhere
near 56K, and uploads will be much slower than 56K.

2299. repost: TAF Atari Flea Market

Newsgroup: comp.sys.atari.st
Date: 1998-11-07 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <3643d49c.0@nemo.idirect.com>
Source record: 90448
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy,alt.atari,comp.sys.atari.8bit

sorry for the repost, some pertinent info was cut out.....

WEDNSDAY, NOVEMBER 18, 1998 is the date for the Toronto
Atari Federation FLEA MARKET! The doors open to the
public at 7:00 PM and will remain open until 10:30 PM.

This is your chance to come to a bazaar of Atari related pre-owned
hardware and software where you may find that peripheral, application or
utility for your ST/Mega/TT/Falcon 16/32-bit computer system or your
XL/XE 8-bit classic computer system.

If you have original software or hardware that you no longer have any
use for, get yourself a half-table and try to sell it! Or find that
treasure that you have always wanted. Great deals should be in
abundance.

Half-Table's will be $5.00 or the Full-Table for $10.00 each.
Half-Table's are FREE to TAF MEMBERS. Admission is $2.00 per non-member
family but if you are selling and have taken a half-table or more,
admission is inc- luded. Admission for TAF members is, of course, Free.

The Flea Market will run from 7:00 PM to 10:30PM, with setup commencing
for sellors after 6:30 PM, and teardown after 10:30 PM. This should
allow enough time for as many people inside and outside Toronto to
attend the event.

As usual, piracy cannot and will not be condoned. You must be selling
original pre-owned software only. If anyone is caught selling pirated
software or stolen hardware, they will be dealt with severely!!

The TORONTO ATARI FEDERATION Flea Market will be held in the "Rose Room"
of the North York Memorial Community Hall on the Lower or Concourse
Level of the North York City Centre Library Building at 5110 Yonge
Street (next to Mel Lastman Square) at Parkhome Ave. Parkhome is 5
stoplights North of Hwy 401 running East off of Yonge

>The fan inthe Falcon was never design to exit the heat!

Without the metal covers you loose the FFC certification :->
But it's better too loose the internal heat. Dismount the
original Fan and place it nearly the PSU inside top cover.

Transformer goes smoke over a temperatur up to 65c. (celsius, not degrees!)
Sometimes you only earn a short ciruit inside transformer.
No replacment transformer..

Do not touch heatsinks on PSU if it works!!

I don't know what the Koala pad is exactly, but if it's some kind of
touch pad with a serial mouse style interface, then you could always use
my Atari Serial Mouse Interface (see my WWW page). However I may be quite
wrong about what the Koala pad is, so it may not work with the interface
at all.

>where I can find it!!!)

There are two parallel port file transfer systems that I know of, one is
parcp which you can get from Dannys's Cyberstrider web site and the other is
paralink which I got from Paul Finch's web site IIRC, I don't have the URL
but I'm sure that he will be along in a moment to fill you in. Neither has
the ability to run progs stored elsewhere.

Rambling aside Ghostlink isn't a solution for actually running progs from
remote drives. Even with a boosted serial port of 38400 or potentially 57600
baud (RSVE/MagiC) it's way, way too slow.

Sound advice - the background printing under MagiC 5 is especially welcome.

The manual suggests that a minimum of 4Mb is required as a buffer if you
want to use Epson microweave, or suffer slow printing speeds BTW.

2311. Re: Koala Pad and the ST/TT???

Newsgroup: comp.sys.atari.st
Date: 1998-11-07 00:00:00 UTC
From: Netman <netman@cyberramp.net>
Message-ID: <36440660.43E53CA7@cyberramp.net>
Source record: 90460
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Mario,

I have heard of your Atari Serial Mouse Interface (from your page).
Although, I am not sure that the Koala Pad has a normal serial
interface.
What I do know is the Koala Pad is a rather old touch pad. I used it
on my 130XE. It has two large buttons, and a 9pin Atari joystick/mouse
connector.

If you press the buttons you can somewhat move the mouse pointer in the
+/- vertical directions. However, I did try installing a driver that
allows you to control the mouse pointer via a joystick. If I plug the
Koala Pad into the joystick port and install the joystick driver, the
left
and right buttons move the mouse pointer in the +/- horizontal
directions.

Thanks for the help though.....I am looking for any info that's out
there...

From: Mille Babic <atari@ebox.tninet.se>
Message-ID: <910432638-216267AEicMi@ebox.tninet.se>
Source record: 90461

Hi all!

The IRC is a very good media to meet others with the same interest, just like (Usenet) News here. Why could not we take some time and meet each other more frequent at IRC, let us say, every sunday 1800 GMT ?

Hopefully most of the members of The Swedish Users Group will enter IRC at the time, in #atariswe starting tomorrow.

Will this meetings at specified time create problems for #atari and #atariswe ?

and is this a good idea?

Best Regards

Mille Babic

Thats right, but didn't some later model 1040ST's also have the Blitter
chip installed? I don't know if they had the menu option to turn it on
or off though. Did that only start with later versions of TOS or was it
as early as the TOS (1.2?) that came with the Mega's because they had
the Blitter chip too...right? ;-)

What types of programs do you want to make? For GEM-applications I
would recommend GFA-basic with Face Value and ErgoPro, it produce fast
and highly compatible standalones. It's also very easy to make really
good-looking GEM-apps with Face Value.

For games I would also recommend GFA, the compiler produce pretty fast
code and you can find some handy libraries for it. STOS would be
better for games though, atleast if you don't mind linenumbers...

2323. Damaged data with an STf....why?

Newsgroup: comp.sys.atari.st
Date: 1998-11-07 00:00:00 UTC
From: graphic@delphi.com
Message-ID: <JFfz0Gp.graphic@delphi.com>
Source record: 90472

I started using a used STf that I had purchased as a back-up to my STe when the
STe finally died (it did only temporarily due to a power supply failure).
While using the STf it seemed to work fine except for extremely long
(2+ minutes) to boot and an occassional failure to boot at all.
The internal disk drive is one of the quitest that I have ever used.

When the STe was repaired, any disks that I had written to on the STf would not
load to the desktop without showing the dialog bocx that says "data on disk may
be damaged". A return to the STF and the disks displayed fine and the
documents would load to wordprocessor with no problem.
Closer examination showed that my terminal program had some control characters
written to one of the "macros", but no problem being run.
I put the disks in an IBM laptop and ran "scandisk" which showed errors
in the "FAT

in the "FAT" and fixed those and also showed damaged sectors (5120 bytes).
The disk was now useable on the ste.
What's wrong with the STf?
Any ideas?
e-mail replies are greatly appreciated.

2330. Atari STuff needed...

Newsgroup: comp.sys.atari.st
Date: 1998-11-07 00:00:00 UTC
From: Prince Corum <corum@sasquatch.com>
Message-ID: <7222ut$so2$1@news.sasquatch.com>
Source record: 90479

Howdy folks, I am finding myself in need of the following Atari STuff, so if you have any of this and would like to part with it, please let me know...

Tweety Board
SF314 or equivalent DSDD FDD
DMA HD to SCSI adaptor
Deluxe Music Construction Set for 3 or 6 voice ST

Aside from the Tweety Board, is there some way to stack sound chips for STereo sound like the C=64 hack? I have a dead ST and have been curious as to whether or not I can just do the upgrade myself, or do I still need the 3rd party hardware?

Thanks!
Louis

2336. v90?

Date: 1998-11-07 00:00:00 UTC
From: starlord@ptw.com
Message-ID: <3644b7b4.0@news.ptw.com>
Source record: 90485

As of Friday, 11-6-98, Network One will no longer support the X2
protocol. If your modem is still using X2, we suggest that you
update it to V.90.

This is the notice that I have found on my isp's web page, as of
that time I'm un able to logon to 2 or the 3 numbers I can call
in on and the 3rd one is a hit and miss deal.

I make a connetion with the other two modems, but the init of
link always fails on them and STinG shuts down then.

The 3rd one a lot of times locks up on the FIND 'Login:' part of
the dial script. And as far as web pages go, if I have to input
anything, forget it, it's so slow it's like I would never get in.

Anyone know what this v.90 is?

That's not a real TOS-feature, you probably have WINX installed. You
can use WINX on your STF as well.

> Do they require soldering in or are they easiliy push-inserted?

No soldering is required, but if you want to upgrade your TOS then go
for 2.06. Any serious Atari-shop (there are about five left
world-wide) will have them.

The tweety board is used and placed on top of the original Yamaha chip, so
if the Mega ST's have them then you can. It does give you stereo sound and
seperate channels, but for anything decent like samples it is very lacking.

Do these units both have the same size floppy drive. I have always
had problems with FAT corruption when swapping information between
computers with various floppy disc sizes, TT 1.44 meg to mega ST 720K.
I formate the disc to 720K but corruption still occurs randomly.
PC to TT it is also common to corrupt the FAT.

Hi

you wont be able to use the TOS 1.6/1.62 ROM's inthe F's. The memory
location and the hardware are completely different. You should be able to go
upto TOS 1.4, whch you can get in either 2 or 6 chip set, this set was
suppose to be the FM equivalent to 1.6.

you could always go for TOS 2.06:)

I don't recommend anyone use high density 1.44 meg disk on 720k drives, the
data isn't very secure because of the medium itself.

Let's put it this way, I can't read a 1.44 meg floppy formatted on a 720k
drive with a high density drive on my ST, I have to use a drive that has a
BIG margin for error to read it. So if you want the disk to go bad or not
worried about the data security then use a 1.44 hd disk, and then when your
data goes bad, I'll charge you a fortune to recover the data.

If you use a hd drive then you have no problem.

Atari, Oh Atari,
Your boot goes flaw-less-ly...
Atari, My Atari,
I've hacked tri-umph-ant-ly...

Your motherboard - is old and scored - but still it boots with pride,
TOS 1-point-0, may still be slow, but it's features you can't hide,

Atari, My Atari,
Now hacked to 2.6,
Atari, Dear Atari,
We love you just for kicks,

With soldering iron, and jumper wire, we'll make you the best yet,
Hacks and progs, from the German frogs, downloaded from the Net,

Atari, My Atari,
When will you ever die?
Atari, Oh Atari,
Will Windows pass you by?

Under Jack Tramiel, you did not sell, and Atari fell to shame,
Bad marketing, and lack of targeting, was not the only blame,

(cut short due for public mercy)

Atari Forever, mates...

Hej Erik,

same old problem again: 3 tries, after around 40 K the transfer stops, CAB goes into its time-out and that's it. Time and time again I encounter this problem... have to try at irregular times, sometimes very early in the morning when it may go OK. The strange part is, these first 40 K go at around max speed, then the transfer stops abrupt. No more single byte coming in. Only occurs when trying to get MyMail (remember this filter I mentioned?) All other sites = no problem, perhaps s-l-o-w transfers, but not like this.
Will try it sometime tonight after 01.00....
BTW, I just changed from SLIP to PPP on my ISP, but everything else still runs well, so I don't figure it has any effect on your site. Besides, it used to be like that everytime I accessed your site.

Source record: 90351

George Crissman <strads@tmisnet.com> wrote:

> I'm using MiNT for the dialup connection to my ISP ... but I don't
> know how to cause the modem to hang up after the session
> without performing a reboot <aargh!>.

> What's the technique for telling pppd to hang up the phone line?

If you have MiNTOS installed with all commands maybe following is
working for you too;

I have this as file "ppp-down" in /etc folder;

```
######/etc/ppp-down
#!/bin/sh
ps -ax | grep "pppd" | grep -v grep | awk '{print $1}' | xargs kill -HUP
######
```

What it does is that it finds PID for running pppd and kills it automaticly.

save two lines between ###### lines as file called "ppp-down" in /etc folder
and run `chmod 755 /etc/ppp-down`

then you can run it and it should hangup your connection ...

Yes, CoMA is still supported! CoMA is commercial but you can find a demo
on the net. Can´t remember the URL, but I´ll find it if you ask. CoMA is
now up to version 4.6. CoMA has English rsc-file and text file.

The same answer again: I don't have any probs to reach his site and to
download the stuff I need. Today at 20:45 (MET+1) I downloaded the new
version with a speed of 3300 bps. No bad isn't it?
I'm doing this with Cab 2.7/Cab-for-MiNT.ovl/MiNT/MiNTnet

Sure why not. Go to the *Commands menu* and select *send file*. You will
get the fileselector then.

Subject: Re: 943-1198 (fwd)

Hmmmm, are you using pap now or do you have the options to use pap?
That allmost sounds like the script is authing you then after the
scritped auth it trys pap. Its posible the portmasters allowed this but
our new box does not. See if you can turn off pap if it is on or turn on
pap and modify your script if it is off.

Not knowing much about the atari hardware I dont know what else to tell
you.

I use Coma to send *.IMG files produced by Papyrus and NVDI. I find it excellent for outgoing faxes apart from the absence of a proper signature.

I don't leave the computer on all the time so I do not receive incoming faxes.

I think the version I have is 3. I looked at a demo of 4 but did not think that for my purposes it was worth upgrading.

Yeah, you need IDE interface by AHDI specification. It is serial built in
Falcon. It's possible build in ST, STE machines. And new Atari compatible,
Milan has also IDE interface. You may buy it, or making yourself.
If there is any interest, I could put schematic diagram and instructions
on my WEB site. It's much simpler and cheaper than SCSI interface or
ACSI-SCSI adapter.

Hi Chris,

Well, I haven't used it with TOS (in fact, I haven't used it much at
all yet), but if you go into Setup; Paths ... then there's a
Temp/Download option. Set this for where you want the d/l's to go,
then use Commands; Get once you've selected what you want to grab :-)

Mind you, I haven't tried this with _up_loading yet... Anyone else?

AFAICS the time-server stuff will only affect the machine's own clock.

If you want that to be stored permanently in the external clock, you'd
have to use some utility to read the machine's data and store it in
the external one. So, does it have anything like that?

Hi,

It's just a matter of resoldering two jumper resistors on the
motherboard. This switches the machine to expect 32-pin ROMs :)

It's not a difficult task - I did it on my STe about six years ago -
you just take your time about it :-))

You asked for sources for the 2.06 upgrade. I'm assuming you're in the
US, so:

Thanks for the info. Unfortunately I seem to have a very early
version - my commands menu only has Make Dir/Go to Dir/Rename
to/Delete/Get files.

I've checked in the About box and it says version 1.0tst.

Can you point me in the direction of the latest version? I thought I
had downloaded a recent version but obviously not!

Whoops!

Forgot to say, only do this once you have the upgrade - the manual
should tell you which jumpers to resolder (can't remember myself ATM).

Just wanting to make sure :->

The new Atari CD I have been working on will be released at the shows this coming weekend. It has just over 200 meg of software and costs only a fiver. Anyone who is interested I will be near the S.H.A.G stall wearing a Silly Software T-shirt, so come over and see the CD if you are interested.

Also there will be a Spectrum emulation CD on sale. Includes the best emulator for the Atari and PC plus 5000 speccy games. Also a fiver.

<snip>

I'm using NEWSie 0.92 right now on my TT with Magic. I no longer
have any problems with it. But I have made sure that WDialog.prg
is absolutely NOT used: is it this that's your problem, perhaps?

Other mail programs also work; the `Okami trio' I find too difficult
to set up, so NEWSie is my firm choice.

Cheers, Charles.

Date: 1998-11-08 00:00:00 UTC
From: Steve Klosterman <s-aklost@ohio.net>
Message-ID: <364650B9.4B03@ohio.net>
Source record: 90384

I was just on the software-technology website and I saw a bunch of midi sequencers. The two that looked good to me were Breakthru 2 and Cubase Lite. Does anyone have any opinions on these or other sequencers? I need a sequencer that I can run on my 1040stf with a Nord Lead and a sampler. The program must be less than $200. Any help would be much appreciated.

>Maybe your ISP offer those services ? Mine offers at least free counters.

No. My ISP offers *one* counter and no guestbook facilities.
That *one* counter is on my index page, but I would like to implement
another counter on my Atari page (as I feel that is where most hits will
be). My guestbook is a bit ropey due to the fact that I never finished
writing the software to generate it, so I'd like to use a 3rd party one to
save me the trouble.

I will take offers for everything. You pay shipping. I want to see it
all go to good homes.

Keep in mind that this is in the U.S. and that youï¿½re check or money
order must clear BEFORE I ship it.

This is a partial list only. I will update it when I have time to add
all the items.

Games:
Sleepwalker - (GREAT GAME) requires 1 meg or more
Clown-O-Mania
No Second Prize ï¿½ motorcycle racing
Lotus III
Fantastic Worlds ï¿½ includes Populace, Mega-Lo-Mania, Piratez, Realms and
Wonderland
Sim City
Falcon Flight Sim
Battle Chess

Apps:
Twist 2 ï¿½ database
Ratsoft ST ï¿½ BBS software
Stalker 3/ Steno ï¿½ telecommunications
Timeworks Desktop Publisher 1 and 2
GFA Draft Plus
Studio Photo ï¿½ image editor
Genus ï¿½ font editor

Programming:
The GP_EDIT Library ï¿½ for GFA Basic
Devpac 3 ï¿½ assembly programming
HiSoft Basic 1
Hisoft Basic 2
STOS Basic and Compiler
GFA Basic 3.5

Hardware
Replay 16 ï¿½ 16-bit sampling for the ST (includes software)

Books
Software Development with GFA Basic 3
Modern Atari Sytem Software
GEM Programmerï¿½s Reference Guide
The Atari Compendium
ST Basic to C

Atari ST Tips and Tricks
GFA Basic Programmerï¿½s Reference Guide Volume 1
ST Assembly Language Workshop (with Disk)

I have LOTS of magazines with disks also. Make inquiries until I get a list up.

Also I will give way disks of shareware to the first bunch of sales. It will be a grab bag of goodies along the lines of the items you bought.

2394. aFTP - any news?

Newsgroup: comp.sys.atari.st
Date: 1998-11-08 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <3644de1c100e700@the-gap.demon.co.uk>
Source record: 90403

I was recently amused to see in the latest Atari Computing, a review of aFTP. Don't get me wrong, I think aFTP is a great FTP program. I use it all the time for my FTP needs. But what amused me was the comment at the end that said *and best of all the Krivakoves squash bugs and add new features at an amazing rate*. I take it by *amazing* the author meant as in *SLOW*, not as in really quick and fast! Although I'm not sure that could be termed as a 'best of all' feature. :)

I've been using aFTP for STiK 1.4beta3 since it was released *back in July*, and I do like it, but it has a lot of quirky bugs (not as many as MGFTP had mind). Such as it hangs for no apparent reason.

I've given up emailing the authors with bug reports. I think I *once* had a reply. This program has the makings of a *must have essential* program, but I'm starting to wonder whether it is still being supported. Can anyone shed any light on this? Is it still being supported? If so, why do the authors seem to not care about responding to bug reports, or issuing updates of the program? No release since July and lots of bugs, really surprises me.

Gary

The Koala Pad is an analog device, much like the paddle controllers of the 8-bit and 2600 VCS machines. The 8-bit joystick ports each had two a-d converters that would read resistance from within a range of 0-30k ohms (I think. It's been a while.) and convert it to a number from 0-255. I believe they used the same pins as the mouse on the ST. The buttons were the same as the paddle triggers, and used two of the same pins as the joystick.

I don't think the ST has a-d converters on the joystick ports.

Gary, don't wanna be rude, but it wouldn't be the first time programmers
do something for the Atari platform, next discover another one with more
prospects and just leave the scene. I've been working with several
terminal programs and at one time found Storm (by Alan Page)... Storm was
pretty good, so I registered and contacted Alan about it. It was said (in
the docs) that registered users would get the latest upgrade plus some
extra features. Never received a thing. Alan told me also he'd started
working on the Mac scene.
Same for Speed of Light, nice stuff for the Atari. So I registered too,
had a phone conversation with Stuart about the key not working, he helped
me out and 1.38 was the last version. Stuart too confessed he'd been
switching to Win or Mac...
What about Canvas? Wasn't that programmed by a 15-year old wizkid? Well,
it still exists for Win, commercial but when was the last update for Atari?

Now with all those idiots trading their half-year-old Win hardware for
better stuff, I reckon the "old" hardware pours into countries like
Czechoslovakia (sorry, old names!), Poland, Hungary etc. etc. Will very
likely make the Atariscene die out over there.

BTW, happens over here too: had several Atari friends over here, yelling
"they were the Atari die-hards", next they discovered the Mac 8600 or
Pentium-2000 with "A-L-P-H-A-B-E-T technology", 4-D accelerator boards and

256-bit sound capacity, 3 Gig L-12 cache etc., and they forgot all about Atari...

Glad we've got guys like you, Thomas Binder, Behne Bros. to name just a few around :-)

Both drives are 720k.
All disks were originally formatted on the STe unit.
I have previously formatted disks interchangeably between the STe and a
Windows95 pentium laptop and never a problem.
still puzzled.

Hmmm....this is interesting....

The disks were 1.44meg-types formatted to 720k, but I've used those for years
with never a problem.
Why is this media any less stable than a 720k disk (haven't seen these on
dealers shelves for years, it seems like)?

Despite what the immature minority have said here, Tony is a mature fella who was self taught for his programming skills, he was able to not only code well he also had the knack of knowing what should go into a good game, two skills his detractors probably fail to get anywhere near.
So what if you don't like STOS, he never has forced anyone to buy any of his progs, He has also made his stuff as free as possible, something else few others would do.
He is a family man who does not go out of his way to harm others. If you cannot say anything nice about him, at least own up to the reasons behind your spite. Just what is your hidden agenda?

: joystick.
:
: I don't think the ST has a-d converters on the joystick ports.

Ah, so this Koala pad is similar to the 8-bit touch tablets that Atari made. In that case I should think you could hack one onto the STE analogue ports. But not to the normal mouse port, it doesn't include analogue inputs.

2416. Why TosBox freezes my screen on exit?

Newsgroup: comp.sys.atari.st
Date: 1998-11-08 00:00:00 UTC
From: onilotreb@yahoo.com
Message-ID: <724erl$as7$1@nnrp1.dejanews.com>
Source record: 90425

Nice day today,
But I still have a problem with TosBox (and hope somebody would help me to fix it). BTW, I have TosBox (under W95+IE4.01+SP1+NU2.0+etc, italian version) in D:\Atari\..etc..\TosBox\tb.exe. It works nice while works, but on exit (on quit.prg) it usually (although not allways!) freezes my screen and I have to reboot Windows. It wasn't doing it as soon as installed, neither when PACIFIST DID (wiht Dragon a bit less often, without any front end almost always), but it was Pacifist 0.48, the 0.49beta doesn't do that joke any more (and I hope not to witch it now :)), unfortunatelly the TB (that otherwise would be my prefered) does. Here is my .ini file:

```
# Sample configuration file for TOSBOX 1.02
# Everything following a '#' is considered a comment, and ignored.

D:\\Atari\ST_PC\TosBox\Tos.img # Specify the location of your operating
system image file here;
# if omitted, it is assumed to be 'TOS.IMG' in current directory.
D:\\Atari\ST_PC\TosBox\tos.rom # C:\atari\tos104.rom

# Request ST memory here in one-meg units.
memory 4

# A secondary break key combination can be defined here in case your PC's
# operating system does not like control+break. The value should be
# expressed as a six-digit hex numeral, encoded as follows:
# bits 0-7: ascii value
# bits 8-15: PC scancode
# bit 16: right shift key
# bit 17: right shift key
# bit 18: either control key
# bit 19: either alt key
break key 0ce001 # cntrl+alt+end
#break key 034fe0 # shift+shift+end

# Uncomment the following commands to set mouse sensitivity if desired;
# lower values increase sensitivity, and vice versa.
mouse x 36 # horizontal: defaults to 13 (ST low/med) or 9 (all others)
mouse y 36 # vertical: same defaults as above
mouse d 500 # double speed threshold: defaults to 110

# Uncomment this to enable blitter emulation.
#blitter

# Select a video mode from the table below. Uncomment the "extend Getrez"
# command to enable the XBIOS Getrez() function to report non-ST values
# for certain modes.
```

```
video mode 5
extend Getrez

# TOSBOX screen # of ____Getrez()____ ____requirements____
# video mode dimensions colors extended normal TOS 1.04+ VESA 1.2+
# ---------------------------------------------------------------------------
# 0 640x400 2 2 2
# 1 640x200 4 1 1
# 2 320x200 16 0 0
# 3 640x480 2 2 2 X
# 4 640x480 4 5 1 X
5 640x480 16 4 0 X
# 6 800x600 2 2 2 X X
# 7 800x600 4 5 1 X X
# 8 800x600 16 4 0 X X
# 9 1024x768 2 2 2 X X
# 10 1024x768 4 5 1 X X
# 11 1024x768 16 4 0 X X

# The "smooth video" command prevents the refresh rate from decreasing
# after a moment of mouse and keyboard inactivity. This causes a speed
# penalty that varies in severity depending on the program being run and
# the video resolution.

# Change the folloiwing to 'A' if you want to boot from a floppy. This
# tells TOS where to find AUTO programs and accessories. Since TOSBOX
# does not support sector access, some bootable floppies will not work.
boot from C

# Choose parallel and serial ports.
use lpt1
use com1
use com2
```

```
# Choose baud translation type.
# 0 = no translation, top speed 19200 baud
# 1 = high speeds mapped to low settings:
# 134 => 115200
# 110 => 57600
# 75 => 38400
# all others unchanged
# 2 = all settings shifted upward:
# 19200 => 115200 2400 => 9600 600 => 2000 134 => 300
# 9600 => 57600 2000 => 4800 300 => 1800 110 => 200
# 4800 => 38400 1800 => 3600 200 => 1200 75 => 150
# 3600 => 19200 1200 => 2400 150 => 600 50 => 134
baud translation 2

# By default, keyboard delay/repeat rates are locked into the PC's
settings.
# Uncomment the line below to allow adjustment via the control panel.
#enable Kbrate

# Wait for keypress after returning from DOS programs.
# pause after DOS
```

BTW, what is supposed to be the .rom format? There weren't any .rom files in tb.zip, I have found nothing on the Net, I think I had simply renamed .img as .rom (or maybe I have even combined something with some .st disk image!). Where some .rom file could be find, or how it can be produced? (Yes, I have STe)
Thanks in advance

2418. Is it possible to browse the Net from PC under Atari emulation?

Newsgroup: comp.sys.atari.st
Date: 1998-11-08 00:00:00 UTC
From: onilotreb@yahoo.com
Message-ID: <724f5o$b0p$1@nnrp1.dejanews.com>
Source record: 90427

Nice day today,

and it would be even better if I knew a way to set some Atari browser under emulation on PC/W95 to work ON LINE. I have tried CAB1.5 and Draconics package, they both work very nice localy, but I haven't been able to connect, nor to navigate when allready connected (doesn't recognize urls). Is it possible under TosBox? And under PacifiST with 'mounted disks' (what about paths?). How the settings should look like. I have TB in D:\Atari\..etc..\TosBox\, PacifiST in D:\Atari\..etc..\PCST048\, 'mounted disk' for PacifiST like D:\Atari\Disk_ST\C etc. Would I need to add something to autoexec.bat in my root directory, or maybe to copy some file(s) to C:\Auto? Nothing I've tried has worked.
BTW, I don't understand some people's attitude 'get rid of 'M$ Explorer', use Netscape!' What a big deal!!! I would really like to be able to gain some indipendence from both, and to use Atari's browsers, but... how? (I do have an old STe, but, it's only 1Mb, without a HD, and I'm not even sure whether its modem port is in function).
Thanks in advance

I thought I had posted the following query but it doesn't seem to have arrived.

I'm using the external clock and Compo's software that I got from Go Direct / ST Review many years ago.

What happens if I set this up using all the items discussed so far, as appropriate, does it alter the clock and override the Compo software, does it use the Compo software or does the plug in clock get very confused?!

Just a thought before I go ahead and give the old girl a nervous breakdown. :-))

I think you will find that the CONNECT.NUM in the archive refers to
some 'include' files which are not there.

Rename CONNECT.NUM to preserve it. Make an empty CONNECT.NUM with any
old editor and try again.

V90 and X2 are two competing protocols for the higher (than 33k8) DCE speeds. It looks as though V90 is winning the battle to become the standard.

I don't see why this is affecting you, Dennis, unless you are actually using a X2 modem and allowing it to attempt the higher speeds. Somehow I doubt it as you would not have been prepared to pay for one of these new modems :-)

I guess a complaint to your ISP is in order as it looks as though they have messed up normal connections when they attempted to bar X2.

On this subject, is it possible to use aFTP without drag & drop? I
can't find any item on any menu that lets you select a file for
uploading via a file selector - a basic facility I would have thought!
Or am I missing something?

I'm using vanilla-flavoured single-tasking TOS.

>
>Lucky b****r! Graphics boards for the TT are as rare as hen's teeth.
>
>I wish I had your problem.
>
Roger, no you don't! With the drivers, the problems really start...

Mitchell, AFAIK the CoCo is a color board, 1 Mb DRAM, Intel 82786 graphics chip, does 8 bit color on a multiscan. It eats 850 mA on the 5 Volt line, the 12 Volts aren't used.

Now for the drivers: gotta look into my files here, I figure I could have a driver upgrade for this one, though I'm not sure. I do have the latest drivers for a TC1208, but these won't work. I've got another set of drivers for a TC1006, and it could be these may work. Have to sort things out over here. If I find something useful, I'll give a holler (lost your original posting so haven't got an e-mail ads).

Now, before you shout "Hurray", I'm telling you Matrix never did a good job on their drivers... Even the latest upgrade for my card (which came out in '93) still causes problems:
That's Write wouldn't show "contents" in the windows, all empty, thus unusable. ST-Guide crashed randomly; one time at calling up HELP, another time upon clicking to a next/previous page. Freedom's icons showed up very weird, best described as "some junk where there should be icons".

Only after upgrading to NVDI 4.12 for this card I got it all working fine. Don't know whether or not NVDI 5 supports the CoCo, it just states it supports Matgraph and TC cards, so you better sort that out with the Behnes. IF your card is supported too, I highly recommend getting NVDI too, saves you a lot of cursing when using the card. The bloody problem then might be that you need an installed version of the latest drivers first... Maybe here the Behnes can help you too...?

I have an Atari 1040STf, running TOS 1.0. I have tried STiK, and STing, with no success on either. Both of these programs bomb right when they boot. I set the programs up correctly (according to the documentation).

Is there an incompatibility with STiK and STing with the older machines? Am I going to be at a loss until I upgrade my TOS?

>This is not true of the SM124.

Well, that can't be true. If the fuse keeps blowing it's likely that
either:

The PSU switching transistor is shorting ... OR
One of the capacitors in the PSU (or power rails) has gone short
circuit.

I suppose it could be one of the rectifiers but this is far less
likely.

If you are not confident with playing around a competent TV engineer
should be able to fix it.

Na, I'm going to wait for Windoz 2000! The one that reformats
your hard drive to the new MS/MFM format that will turn a 5 gbyte
hard drive into a 20 meg one and that has monitor outputs for
monitors that have not been designed yet and will install a
progam in your auto bat file that logs you onto the Bank for MS
so that they can deduct from your checking account their normal
daily user fees that range from $250 to $1,000 depending on the
amount you have. Or they can auto patch a lean on your homes
trust deed. All in the name of Better and Safer Computing!

Strictly speaking, this is not correct.

X2 and KFlex were competing, proprietary 56k modem chipsets.

V.90 is the new, ICU ratified STANDARD.

All X2 modems from 3Com/USR are upgradable to v.90, and almost all KFlex modems are upgradable as well.

There were 3 files that came with the clock - Autoclok for the Auto
folder, clock .rsc for the root directory and one for adjusting the
clock manually. These were done in 1992 so 'net adjustments were
unheard of then.

Rick, never experienced this specific problem... I had s-l-o-w
connections, fast ones, intermittent ones, but Erik site before has
offered me the same trouble: after somany bytes it stops and sits there
forever, until CAB times out. Other occasions: hardly a glitch.
Yesterday evening around 1900 3 tries, all ending after around 40 kB, next
I tried at 2215 and max speed in one go...

Demon's terrible since a fortnight: s-l-o-w connections to the servers.
When connected, no problem. When I change from the newsserver to the e-
mail server, sometimes have to wait 30 secs. Next go another server, and
another 30 secs delay. BTW, the newsserver was terrible when I came home
tonight at 2130, I think all the 50 newsmessages took around 5 minutes to
come in. Drip-drip-drip, like that.
I think they have to many customers rite now. Lately sometimes I need 10
tries on the phoneline before I get connected, before that used to be on
the first dial-in... at any time!
What irritates me too is that since some time I don't get any maintenance
info any longer. Just this e-mail about this Back Orifice thing...

Perhaps it's about time to go after a cable-connection :-)

I had that problem with the 520STFM and with the 1040ST....I would get
these vertical stripes or lines on the screen and everything would
freeze. I would have to re-boot. I traded the 520 in on a 1040ST, which
in turn had a defective motherboard which was replaced and all's been
well since.

I have actually seen the same thing happen on my PC (386 upgraded to
486) and that turned out to be a memory (chips) problem.
Good luck!

JL>
JL>|Is there any Fax Software for TOS machines anymore?
JL>| . . . .

There are even 3 good programs:

JUNIOR OFFICE by TKR.
It is available as a fully functional version on several ftp-servers.
Very nice program, but no direct-faxing via your word-processor.

There is also the pro version of this program, called TKR TELEOFFICE. But it is
not spreaded via ftp. Commercial program available from your dealer.
TELE OFFICE is able to do direct faxing via your wordprocessor.

Another good program was Q-Fax pro. This software is commercial too. Direct-faxing
is possible too. Disadvantage: doesnt support all serial ports.

Since a few years, a _VERY_ good alternative is STarCall by Ingo Linkweiler.
This is a complete package of actually 3 programms:
- STarCall, the terminal software
- STarFax, the fax software (some kind of pumped up Q-Fax...). Even a GDOS driver
is included, so you can fax directly via almost every software.
- STarBox, a BBS program.
StarCall is shareware. A fully functional copy can be downloaded on the net.
---> http://www.ob.rhein-ruhr.de/INFINITY/

Last but not least, CoMa, the fax manager. Good program. A so called crippleware
version is available on several ftp-servers and on the net.

I would recommend either JUNIOR OFFICE or STarCall. Just get them both and
make your decision :)

Bye, MC.

Dennis,

I know it's offtopic here, but do I sense a slight aversion against Microslop here? Did you know the Y2K compliant hardware now needs a Megatower to accomodate all 4 ISA slots, 4 PCI slots and 8 AGP slots, plus the triple-fan-cooled Washington processor running at 1500 GHz, needing a 1500 Gig E-E-E-E-E-E-E-IDE drive to accomodate W-2000 alone plus the power supply that needs to convert from 3x380 Volts to 5 and 12 volts on around 250 amp lines? Heard rumours the plugs to fit the watercooling onto will be fitted standard... The set-up-Devil has been greatly enhanced too, the bloody problem is, the whole thing is patch #7,456,293 for the original system :-)
Oh yeah, 4-D GFX cards now need at least 256 Mb XABCDEFGHIJKLMRAM, and the soundboard is 512-bit. Speakersystem capable of at least 2x1500 Watts needed too... Launch for the whole system is foreseen at around X-mas 1999, marketed as the Multi-Idiocy System... but all this is highly confidential!

Source record: 90267

Hello all!
Well soon, by the end of the week, my new, PowerMac 333mhz will come
in..
Im pretty excited about it, so I just thought I'd tell all of you :)
I dont plan on leaving the scene though, as I still have my Falcon, my
MagiC PC and now my MagiC Mac ..
Hmm.. i wonder how faster it will run MagiC mac..
Bye guys
Btw, Atari.org was down today, so who everyone who tried to get to
bengy.atari.org, the actual URL to the MagiC support page (incase it
goes down again) is http://www.telusplanet.net/public/bengy/

2459. Desing webpages for free

Hello!
Well I love making webpages sooo much, that Im offering my "services"
for free to any atari user :)
If you have tried making a webpage, but just dont like it, hate HTML, or
what not.. just give me a shout..
No guarentee's either. Im pretty busy right now, i just finished
redesigning the SS support page, and now im doing the homepage for Nut
of F.U.N.
Ohh, like I said, this is only for atari related pages.
If you would like to see some pages I have done..

personal web page http://www.bulli.com/basement/
MagiC support page http://www.telusplanet.net/public/bengy/
StringServer Support page http://www.bulli.com/basement/ss/ss.htm

oh there is one catch. If it is a program support page, you must send me
the registered version of the program :)
Bye

Hi,

Did you use the parameter -d ? This is the uncompress mode. "gzip" is for .gz & .tgz extension. If they are .Z extension, you need "compress" program. For the .tgz extension, you still need to untar it using the "tar" program. Most files for Unix are normally in the "tar" format. It just makes an archive of it but does not compress. So ppl normally do a gzip on the tar after that, hence the .tgz extension. Sometimes, the older generation likes to use .Z compress instead. So watch out for those extensions!

I use these lot of programs on my MiNT setup. You can get them from any MiNT ftp archive site.

HTH.
William

Your mouse has moved. Windows NT must be restarted for the
change to take effect. Reboot now? [OK]

2464. atari monitor problems

Newsgroup: comp.sys.atari.st
Date: 1998-11-09 00:00:00 UTC
From: turner <menshevick@hotmail.com>
Message-ID: <3646940D.67F@hotmail.com>
Source record: 90296

I recently purchased an atari 1040stf with a monochrome monitor for sequencing. I left it on over night and the next day I noticed that the monitor was not displaying anything. Messing around with either the contrast or brightness knobs does nothing. It does turn on, at least the led on the front does. Also I noticed that when I switch on the atari its self, the disk drive activity light stays on untill I put a disk into it. Now I'm asking you before I ask the person/company I bought it from so that I can possibly avoid shipping it to the opposite corner of the country (which cost $55 last time). Is it a problem with the monitor, the computer, or am I over looking the obvious?

Thank you,
Robin Turner

Cross-posted to: comp.sys.atari.st,misc.forsale.computers.other,misc.forsale.computers.mac-specific.misc

SyQuest 88 megabyte removable hard disk system with 6 (or 7) cartridges.
Drive is in perfect condition and all carts have NO bad sectors and are
in perfect condition too. Rarely used - only used for monthly backups.
This drive can also read 44 MB cartridges. This drive is SCSI.

Comes with 14 day guarentee to be free from defects.

Bare drive with 6 carts for only $224.

Bare drive with 1 cart for only $97.

Carts separately only $37/each.

Possibly available is an external case made just for this drive.
Most likely $20 _with_ purchase of the above drive.

2466. FS: Winnipeg Atari ST User Group fundraiser blowout! MUST SELL!

Newsgroup: comp.sys.atari.st
Date: 1998-11-09 00:00:00 UTC

Source record: 90298

GIANT ATARI ST HARDWARE / SOFTWARE / MAGAZINE / BOOK BLOWOUT!

Yes, our sale is still happening! All prices knocked down another notch. Check it out!

The Winnipeg ST User's Group (STUG) is having a huge fundraiser to help keep our still-going-strong user group in good health, clear out some useful software that isn't getting much use, and help members do the same. The majority of the proceeds from all sales will go directly towards helping the club which has been promoting Atari since 1986 in Manitoba, Canada.

Please look through our list and pick out something you can provide a good home to. All hardware/software is fully guarenteed for 2 weeks from receipt. Everything comes with full email tech support from a knowledgable STUG member, we'll try our best to help you out!

If you want a whole bunch of stuff, discounts are available. Let us know what you think is a fair price. We just want good homes for all this STuff!

Every item purchased includes an issue of the STUG Chronicles (our newsletter) FREE!

All prices are in US$ funds as most sales tend to be to the US and so it makes everything easier that way. Canadian prices should be calculated accordingly.

Shipping is extra and NOT included in the price listed.

Thanks for helping out our user group!

Trevor Cordes - STUG President
trevor@cyberspc.mb.ca

*** MUST SELL THESE MAGAZINES TO GOOD HOME! SEE BELOW! ***

The Winnipeg ST User's Group (STUG) is having a huge fundraiser to help keep our still-going-strong user group in good health, clear out some useful software that isn't getting much use, and help members do the same. The majority of the proceeds from all sales will go directly towards helping the club which has been promoting Atari since 1986 in Manitoba, Canada.

All prices are in US$ funds as most sales tend to be to the US and so it makes everything easier that way. Canadian prices should be calculated accordingly. Shipping is extra and NOT included in the price listed.

Thanks for helping out our user group!

Trevor Cordes - STUG President trevor@cyberspc.mb.ca

>Okami is far superior to any other Atari package for email/news, and really
>should be *the* front runner IMHO.
>

Gary, PMFBI, but I totally agree. What potential users probably frightens
is the complex setup, where complex stands for "loading all the .INF files
into a texteditor, read the docs/hyps/mans/infofiles thoroughly and change
the settings". I agree it's time-consuming, it can't be done in a few
minutes etc. People are used to "set-up windows", then Save Config and
that's it. I recall fetching Okami 1.34 from somewhere, looking into it
and I thought "Christ, that will take some time and I need to start
reading first". On the first run it ran (with the exception of the
Sequence.seq file which had to be created) and it ran OK. If one can read,
one can install Okami... I'd say: if one can make Sting run correctly,
Okami shouldn't be trouble too.
Perhaps it's a good idea to make a "predefined O.INF" for use with
POP/Newswatch, people only have to fill in personal details, change the
partition letters and sig files. They still should be able to "read",
though... What I'd like to have added to Okami, are some keyboard
shortcuts for Import/Export/Maintenance (or did I miss something in the
docs?).

2470. Re: Which midi software to buy?

Newsgroup: comp.sys.atari.st
Date: 1998-11-09 00:00:00 UTC
From: cmassey@gate.net
Message-ID: <726a4r$141a$1@news.gate.net>
Source record: 90302

Hi Steve,

I have been a user of EditTrack which was originally a Hybrid Arts program. The latest version is MidiTrack Platinum and is available from Systems for Tomorrow.

It doesn't take much memory and does everything and more that a working musician needs.

They even have a SMPTE version for syncing to tape.

You'll love it as I do!

2471. Re: EZ230 Problem

Newsgroup: comp.sys.atari.st
Date: 1998-11-09 00:00:00 UTC
From: cmassey@gate.net
Message-ID: <726a57$141a$2@news.gate.net>
Source record: 90303

Charles,

Hopefully, my possible solution to my 230 problem has been posted. In case it hasn't, we feel it is a cable adaptor problem and ICD is building me a very short adaptor from the LINK2 (50 pin Centronic) to the EZ230 (25 pin). I had a 2 ft cable and it has too much power loss for the LINK2.

Thank you for your suggestions about Diamond Edge. I am still learning about this program and don't fully understand Mirror. I will study your answer and put it to use.

Charlie

Assuming both drives are 720K Doouble sided units, and you are not using
HD floppies instead of the proper DD ones, then it sounds like one of
the drives is suffering from misaligned heads. This would cause data
from one drive to only be readable on that drive.

Not much you can do about it I suppose, as dismantling a drive and
realigning the heads requires some precision equipement. If you are
brave and don't care about messing up the drive and a few disks for
good, then you could try fiddling inside the drive with a screwdriver to
see what you could do. Getting it professionally fixed would cost more
than getting a new drive.

You can still find them if you look hard. The HD disks are not
interchangeable with DD ones (otherwise, why would the manufacturer put
an extra whole in them?). The magnetic surface is more sensitive on HD
disks, because of the voltages of the magnetic field generated by the
drive head being different.

> What TOS will allow the STf to work more like the STe?

TOS 1.62 will not run on an STF. I think TOS 1.04 uses the continuous
scroll, so your STF is probably a 6 chip TOS 1.00 machine.

The latest TOS was TOS 2.06.

> Who sells the better TOS chips? What are the version numbers?
> Do they require soldering in or are they easiliy push-inserted?

Check out the ST Quick FAQ.

Yes, but PC compatibility with an STE is ok, whereas with an STF, it is
more problematic.

This is all in the Quick FAQ.

You can upgrade an STE to 2.06 by just changing 2 jumpers. The sockets
are 32 pin ones.

I'm afraid it's time for an upgrade. At least an STE with 4megs and HD
should be ok.

Try getting it repaired in a local TV repair shop. Bring over the ST
with a blank disk so that the guy can get a proper signal to display.

Pera Putnik (piters@eunet.yu) wrote:

: Yeah, you need IDE interface by AHDI specification. It is serial built in
: Falcon. It's possible build in ST, STE machines. And new Atari compatible,
: Milan has also IDE interface. You may buy it, or making yourself.

However I believe the Milan IDE interface is not Atari compatible and
therefore would not work with this driver?

Also I believe the important point about this driver that makes it
different to all the others, is that it allows you to access IDE drives
from a PC, by swapping the bytes.

ROTFL sounds like good sport.

Wasn't it the Python team who dreamed up the 'Confuse a Wombat' sketch
(I may have got the animal wrong)?

Perhaps, when at a loose end, we could take up the sport of 'Confuse a
Dixon's Salesman' or even, from a previous post, 'Confuse an ISP's
Helpline'.

I guess you have 512Kb RAM and NO hard disc?

I think that this should be perfectly possible but you would certainly
be pushing your luck if you tried any http:// stuff.

You will need HSMODEM to clean up your serial port.

If your ISP supports SLIP then use STiK as TCP/IP and Dialer. If only
PPP is available you will need to go for the rather larger STiNG.

For the news/mailing you should have a go with Newsie although there
are other options.

Almost certainly the monitor, Robin. Is there any chance of you
checking this by borrowing another mono or RGB monitor?

The monitor LED indicates that the PSU is probably OK (it often
blows). I would guess that the line-output transformer or the tube is
broken - most likely the former.

There is just a chance that the GLUE chip in the 1040 has broken (this
generates the video signals among other things). Again you would need
to borrow a known-working monitor to check this.

It's probably a problem with the monitor itself. The drive activity light only indicates that your ST is/was looking for a disk and never found it (it probably turn off when you insert a disk).

You could try your ST on a TV screen or another monochrome monitor to check it.

By the way, have you checked the ST-monitor wire ? Is it correctly plungged into the ST ? Your cat/housemaid/little sister might have touched it...

I have been getting problems on my external 500meg SCSI
drive,I use Optimizer 27 and Edge both keep on reporting
problems with clusters and Fats,I also did a bad sector
test,it found some and marked them bad.
This problem came back and now its reporting 157 bad
sectors,has something gone wrong with the drive,is it
the bin time,your help please.

If I have to replace my H/Drive can I put a Zip drive in
its place,I was thinking of the Zip 100,are these OK,I
see on this newsgroup that people have been getting problems
with there removable media,is this a good one to go for,
any help on this one as well please,thanks,
Rob.

I've had no troubles whatsoever with the Zip drive on my TT, although
it's not being used as a replacement for the hard drive. Other people,
though, may have horror stories to tell.

I use a simple ST for news and e-mail, with Sting and Newsie (and HSModem to correct RS232 TOS routines). It works fine (except I don't like Newsie very much. Maybe I should try that Okami thing) and I suppose it might even work with a 1Mb floppy ST...

But of couse, you SHALL have to use a modem. An old 14400 bps will be far enough since the RS232 can only transfer up to 19200 bps.

I think you did. For import, export, and expire, there are the
commands `import', `export', and `expire', respectively. And of course
you know that, in Okami, you can bind any command to any key you wish.

Source record: 90327

You should be aware that both of these utilities assume that the
maximum partition size is 256 MB (as far as I remember). Edge
has trashed partitions larger than this so, so I avoid it.

Also, there are limitations related to TOS versions:

TOS 1.00 & 1.02 = 256 MB maximum partition size.
TOS 1.04 - 3.06 = 512 MB maximum
TOS 4 and MagiC = 1 GB maximum

The Zip drive is still probably the safest removable media out
there, along with the old Syquest 44/88/105 MB cartridges, so
it should work fine. The new Zip+ is even better, I'm told.

Either ways, I recommend using HD-Driver 7.51 or more recent,
since it has a few special functions to support recent types
of removables. System Solutions (UK), Systems for Tomorrow (US)
and various German suppliers stock it.

When using a new formated disc and downloading in a PC, some times when
transfering the file to a TT New desk reports damaged disc. As I have
2 TTs, I don't think it is a hardware problem. When this occurs, discs
are not even reformatable, just garbage.

I have two Atari ST's for sale + extra rodents, joysticks, leads etc
etc.

Systems include a 1Meg and a 4Meg system + lots of bits and pieces.

Also lots of Atari PD, clip art and blank formatted disks.

I also have about 20 original and boxed games.

Lots of books and some Atari mags.

If interested please leave email address and will forward comprehensive
list.

This "blackout" have a lot of technical sources..
Maybee it's the SM124, not the computer.
The best way is a repair shop. The case contains nothing
for "homebrewed" fitting service. ;)
(You must know what you doing)
Dangerous work..

2503. SM125 Monitor

Newsgroup: comp.sys.atari.st
Date: 1998-11-09 00:00:00 UTC
From: Amy Macdonald <amacdona@shaw.wave.ca>
Message-ID: <364726BC.DAD3D83B@shaw.wave.ca>
Source record: 90335

Has anyone ever fixed the SM125 after the fuse has blown and get the monitor to stay operational? I've been told that it's impossible to fix the SM125....the fuse just keeps on blowing once it goes the first time. This is not true of the SM124.

The SM125 has a brightness and loudness control at the (bottom)front as well as buttons at the back for horizontal and vertical screen adjustment.

Hope someone has an answer!
Thanks...Amy.

To my knowledge, HP never came out with (Atari) drivers for anything above the HP deskjet 550/550C.......I purchased an HP 660/660C deskjet printer and the software for the 500 series works fine. Hewlett Packard may still provide people with the 500 series driver.....I use PageStream, which has the 500 dj series driver and it works fine. It also works with Multi Writer and several others.
To fine Hewlett Packard on the net, just do a search on HP.
Epson....I don't know.

Have I misunderstood something here? What exactly do you mean by
"continuous scroll"? If you mean real-time scrolling of windows then
this is definitely not the case with my own STE (1.062).

>proper signature.

It can also be used for sending faxes made by Calamus (all versions).
Works very great. I'm a registrated user of CoMa but I'm not using it very
much thus I don't know the prog very well. However I think it is
possible to use a signature with the footer image.

IMHO CoMa is the best Fax prg for the Atari. It works on every
configuration I tried. Geneva/Neodesk, N.AES/MiNT/Thing/ SingleTOS, with
or without graphic card. With other words superb and above all it comes
with English docs.
The latest version is 4.7.0.
Depending which version you want the registration fee range from 44 to 99
UK pounds.
A demo version can be found on the Belgian ftp-site 193.190.205.13
atari/incoming/telecomm or on the homepage of Softbï¿½re Software
http://members.xoom.com/Softbaer/index.html

There is also Starfax and Teleoffice. Both can be found on the Net.
A beta version of Starfax is certainly on the Belgian ftp-site. Look for
star25be.lzh. Starfax runs also on every Atari.

>I think the version I have is 3. I looked at a demo of 4 but did not
>think that for my purposes it was worth upgrading.

IMHO Upgrading is always a good idea because each upgrade has some bugfixes
(and new bugs implemented) Furthermore the upgrades are free.

: I remember something called ST Fax that had drivers for the most
: popular atari documents, such as PageStream, AtariWorks, etc...

: Is it possible to buy that package still?
: Any alternatives still on the market?

I'm using the free mgetty+sendfax software (with vgetty). It didn't compile under MiNT initially, but it wasn't too hard to get it going. However I didn't do a very good job of it, and the version I'm using is rather old now, so I didn't announce it. But it works for me. With this you can do fax, data and voice on your modem with complete flexibility.

However it may be rather more than you need. If you just want a simple straight-forward FAX program without all the bells and whistles, voice and data support etc., or if you don't use MiNT, you will probably find some other fax software like STraight Fax to be more suitable.

Email me if you'd like me to send you my MiNT version of mgetty+sendfax and vgetty.

I wonder why you find the 'Okami trio' too difficult to set up?
POPwatch and NEWSwatch are a doddle to set up, that's the point.
Admittedly Okami can be a bit of a swine to set up, but it's not that
difficult. I'm thinking of making a sample O.INF file available on my web
site to ease the pain.
Okami is far superior to any other Atari package for email/news, and really
should be *the* front runner IMHO.

2517. SVGA for TT ?

Newsgroup: comp.sys.atari.st
Date: 1998-11-10 00:00:00 UTC
From: Kylo <grabek@hermes.umcs.lublin.pl>
Message-ID: <36484F1B.2BEE@hermes.umcs.lublin.pl>
Source record: 90145

Hello everybody. I'm writting to the group for the first time.

I own an TT. The computer, although very nice, has an 'old-fashioned' graphic modes. Is 640x480x16 sufficient for everybody? I thought one can buy an old SVGA PC card very cheaply, which reaches - say - 640x480x 256 colrs, or 800x500x 16 cols. It's better than TT.
But there's a problem - how to connect an ISA card to the VME bus? I have two doubts about that:
1) the REFRESH signal indicating that a DRAM resresh cycle is taking place. But I have no information about when this signal occurs in the bus cycle and what the devices (cards) should do then. I think the signal is generated by the card and then the bus master (=a PC) is waiting until it is finished. But I'm not sure. Does anybody know anything about it?
2) the memory access. The obvious way of the work of such a graphics card is that Atari generates the graphics (screen bitmap) in a graphics card memory, and the graphics processor (on a card) displays the graphics. But how to do that: to change the screen memory address only (can it be set to VME memory range?) or to patch all the VDI procedures so that they 'draw' to the VME card.

Has anyone any ideas?

Greetings,

Chris :-)

I can certainly vouch for my ISP, Internet Direct in Toronto.
Although not >officially< an Atari-friendly ISP, they've been very
supportive and knowledgable in getting connected, and they give a
two-week turnaround if you're not staisfied with the service. I've been
on with them for about two years, and they've been superlative,
especially in setting up my web pages. Plus the techs I've spoken to
have never laughed at me for mentioning I'm using an Atari, rather
they're intrigued.

BTW, Idirect also is connected with Tucows, the big
Internet-software web service.

Yes, I know, that I didn't discovered hot water or America. But could
referred drivers work with PC hard disks ? I didn't saw any word about it.
I know couple Atari (Falcon) users who wait such driver long time.
Beside byte swap other important feature is recognize of (Big)Dos
partitions on PC disks. And easy to use...

I had the same troubles with my 540meg scsi seagate drive, was
driving me nuts, so I endedup calling seagate tech, it turned out
that the drive had a 2nd set of jumpers and for ibm/clone useage
the jumper was ON, but for Atari (and the guy knew just what I
was asking about, he KNEW Ataris!) I removed the jumper cap
turning them OFF. Theses were NOT the ID jumpers. So you might
look for something like that. Now I've had the drive running in
my TT just fine. And if you think yours was slow ... I had to do
my 2.1gbyte not long ago! Whew!

Yes.

> PC can't read Atari floppies and vice versa ....

Not correct. This is most certainly in a FAQ somewhere, but here's the
procedure:

1. Insert a DD-disk in your PC. Format it to 720Kb.
2. Insert the newly formatted disk in your ST and copy the MIDI-files
to it.
3. Insert the disk in your PC and read the files.

If your ST has TOS 1.04 or newer, or you have FastCopy or similar, you
can skip #1 and format the disks on your ST.

2532. Atari Drawing Tablet

Newsgroup: comp.sys.atari.st
Date: 1998-11-10 00:00:00 UTC
From: shimh@clpgh.org
Message-ID: <72a35v$ud3$1@nnrp1.dejanews.com>
Source record: 90160

Hey folks, I found an Atari Drawing Tablet still packaged new in the box today. I realize this was probably designed for the XL series, but the box says works with any Atari computer w/16K. I was wondering if I can get it to work w/my ST as it seems to have the standard 7pin(?) mouse/joystick jack. It comes w/a cartridge that has a drawing program for the 600XL. I was going to take it home tonight and try it but was hoping to get people's opinions and/or experience with it and tell me if it's worth it. Should I try the mouse or joystick port and also is there a hardware cartridge adapter or emulator that does 8bit Atari on 16bit machines? Thanks in advance. -H

guess I'm the guy you have to shoot on that one :) I based that
actually on how fast they were able to provide a fixed version of the
current beta (the previous one had some problems with crashing my
system). You'll be sure I be called on the carpet on that one in the
letters pages of AC #12.

PC's are very peculiair about disk format.
Rule of thumb is: format on a PC, then he can use that disk at least.
Atari has no problems working with those disks.
But the other way around is asking for trouble.

Experience learns me: when formatting on Atari using FcopyPro I have
the choice: 'make disk MS-DOS or not'. Then there are also no
problems. But formatting from the desktop is no good.

2537. N.AES + NVDI 5

Newsgroup: comp.sys.atari.st
Date: 1998-11-10 00:00:00 UTC
From: atarist@xs4all.nl
Message-ID: <72a2kgrlb3@news2.xs4all.nl>
Source record: 90165

I have tried to install NVDI 5. Look like OK, nice and eassssssy.

With reboot: 'wrong pointer to Freemem'.
and nothing worked as before.
Starting QED (and others also) give 'illegal instruction'
followed a few seconds later with 'leaving Mint'.
I feel very frustated with this non-solicited action of my computer.
Only reboot saves me.

Conclusions:
after trying out many things: WDIALOG was the bad guy.
Version 2.00 more then 1,95 (also tried, the older vesion did not
lead to 'leaving Mint'.) but was nearly as bad as new.

After trying everything I made an entry in NAES.cnf

run c:\.....\wdialog.prg

And that seems to do the tric. At least I can type this message in
QED with Newsie .

Other mystery remains: why bombs COPS by booting? (went back to
XControl)

Met vriendelijke groet,
Ronald van der Kamp

> I feel very frustated with this non-solicited action of my computer.

Unfortunely this version of NVDI is very "ASHified", which means that
it really needs MagiC to do it's best :-(I'm seriously considering
downgrading to 4.12, my Falcon (MinT 1.15.1, N.AES 1.2) is not nearly
as stable now as it was. Especially CAB crash a lot.

> Conclusions:
> after trying out many things: WDIALOG was the bad guy.
> Version 2.00 more then 1,95 (also tried, the older vesion did not

2.04 is the latest (?), and the one that works best with N.AES.

> After trying everything I made an entry in NAES.cnf

> run c:\.....\wdialog.prg
Yes, you *must* run it from n_aes.cnf, or from the desktop. Starting
it in the autofolder will result in serious errors.

> Other mystery remains: why bombs COPS by booting? (went back to
> XControl)

Because COPS needs Wdialog, and Wdialog isn't initialised yet when
COPS loads... Use the program COPSLOAD from the N.AES-distribution
(1.1.7 or newer).

Well, I must have one of those days...

whatever I try, don't get it working...

added lines like

*E export

to Keymap.inf, but no go.

Then tried:

*E cmd export

but all Okami says is "unknown cmd" (with the tsk tsk button)

Must have missed more.... I try to follow this keymap.inf information, but
no way. BTW, I'm using 1.35B

I added some commands to set kill flag and move on to next msg without any
problems some time ago...

Well, speaking of Demon in Holland, they're not Atari unfriendly. As
usual, those people hardly know about stuff other than Win and Mac, so
don't blame them.

When I inquired at Demon for an account, the telephone-miss answered "I
don't think we can handle Atari, Sir". When I got on to the tech, perhaps
I was lucky the guy had a friend with an Atari surfing the Net, so at
least he KNEW it was possible.
You simply don't go asking these blokes for specific hardware/software
advise when you run Atari stuff. BTW, when U're running Linux or something
alike, they probably don't know a thing either.

No ISP is Atari-unfriendly. Run a Sun, Silicon-Graphics, NeXT, Amiga or
any OS other than Mac OS 8 or Win and they're stuck. Can't blame them,
really :-)

Hi all,

due to some sad circumstances, we don't get through to the first mission
in our Elite game (the classic Elite!).
I think our version is somehow screwed up!!!
Could anybody send me a working Elite game?
Simply attach it to the reply... I think copyright issues don't matter
in this case.
I'm indepted forever to the freak who helps us out of the trouble. ;)

Ciao, Jens.

Are you a member of the former Atari 'scene'? Did you, perchance,
visit the "ST News International Christmas Coding Convention", in Oss,
Netherlands, December 1990?

Then you should not wait a second longer and surf over to
http://www.scriba.org/stniccc2000 to discover that, in fact, a reunion
of that very historical event is being organised for December 2000, a
10th anniversary reunion as it were! It is going to be the coolest
event on the other side of the millenium change, I can assure you!

Did you set your software up to have the boot particiaian. Load the
ICD Driver, then load HDUTIL.PRG and set the boot partican to drive
"C", then try rebooting.

Indeed, I have installed the driver. And the machine will boot from floppy fine, giving me access to the harddrive fine. It's just when the harddrive is set to autoboot, it bombs out right after it loads the driver.

>Also you must set the boot patition (C: probably) as 'bootable' (or
>enabled) using the ICDFMT 'Write Partition Info Only'
>
>

I hadn't done this, but I did follow the ICD readme instructions to the letter. I still have it set to "boot from floppy", and I am fearful to set it to anything else.

The jumpers I have to set on mine are:

Manufacturing Enable (Caution! Factory Use Only)
Unit Attention Enable (Present When Shipped) - will inhibit unit attention
on poweron or scsi reset
Start on Command Enable (Present When Shipped) - When removed, the spindle
motor will start only on receipt of the Start Unit command.
SCSI BUS Parity Enable (Present When Shipped) - When removed, the drive will
not check for parity
Spindle Synchronization (Not Present When Shipped)
Terminator Power Source
External LED
SCSI ID2
SCSI ID1
SCSI ID0

that's about it...any help?

Mitchell,

I have a Matrix Coco so, if you have not solved your problem yet, I
may be able to help you.

I have never experienced the problems that Louis describes, but I
never succeeded in getting the Coco to work in my TT, although it
works perfectly in my MSTe.

The problem was hardware related and may derive from the current drain
that Louis mentions. The monitor would flash on, and off again, about
once per second. The picture was normal and I could see enough to move
the mouse around.

Well, I think you think wrong: try to install W-98 onto a 160 Mb HD and
find out what works...

Yup, I forgot to mention in my previous posting, that with this new
"VVVRRROOOOOOOOAAAAAARRRRR" racing monster (talking about the Y2K-MIM) it
takes just as long to read the 25 lines of text from a Word-2000
document (which would take up approx. 256 megs of disk space anyway) than
I need to read the same ASCII file on my stupid ST :-)

2570. Re: atari monitor problems

Newsgroup: comp.sys.atari.st
Date: 1998-11-10 00:00:00 UTC
From: turner <menshevick@hotmail.com>
Message-ID: <3647CA59.7993@hotmail.com>
Source record: 90280

I checked and double checked the monitor cable (the monitor is an sm124
to clarify that). Also I booted the computer on a disk labeled "boot"
which came with it (though I have never used it since it boots to TOS
anyways, and as far as I know the disk could have anything on it), the
computer appeared to read the disk and and then it stopped as would be
expected. Before the damn thing quit on me the image on it was a little
bit "wobbley" (for lack of a better term).
I gather that all of this points to a broken tube.
If I am correct in assuming this (please reply), then I'll see if the
company I purchased it from will re-imburse me or replace it.

Thank you all for your thought and effort

Robin Turner

2571. ICD Host Adapter Problems

Newsgroup: comp.sys.atari.st
Date: 1998-11-10 00:00:00 UTC
From: David Jackson <anderon@ix.netcom.com>
Message-ID: <728omg$hgs@sjx-ixn9.ix.netcom.com>
Source record: 90281

Well, I got a copy of the ICD Host Adapter software, and off I got to format and partition an 800 Mb Toshiba SCSI drive for my 1040STf.

Things are going well - the whole job goes in pretty easily. The whole achingly slow formatting and partitioning routine is complete.

Now, everytime I write something to the drive, things go smoothly, until I reboot the system. Then I can't boot from the harddrive anymore.

Does anyone have _any_ idea why this might be happening?

I purchased a copy of HiSoft C recently and despite of some odd quirks, I have been enjoying it. Unfortunately, it doesn't allow you to compile a program. You have to use a C compiler to do this. Has anybody compiled code using HiSoft C? For some reason, my Laser C doesn't like one of the files that came with HiSoft C that you have to compile first and I don't know how to change so that it will work. Any advice would be appreciated.

I'm now gathering infos about all VME cards that improve the graphics
of a stock TT and existing network cards (DMA Bionet, etc.).

If you know anything about them, have the e-mail address of people
who previously developped those, or would care to scan the docs and
zip the drivers for future grouping in a download page, please let
me know. I

If you can contribute anything else about 3rd-party hardware for the
TT030, please let me know. Your contributions to this FAQ are welcome.

No, not real-time. "Continuous scrolling" was introduced in TOS 1.04 I
think. If you keep the mouse clicked on the down arrow on scroll bar,
then the window will scroll down to the bottom of the page. On TOS 1.0
the scrolling is step by step, you have to keep clicking to scroll down
a whole page.

That's one way of telling if you have TOS 1.04.

Are you sure all the programs are run in the correct order ?

You must run DRVIN.PRG, then MFP.PRG, then STING.PRG. Use an autofolder
utility to make sure they run in this order, or copy them to a temporary
folder, then copy them back to AUTO one by one.

Have you set up the CPX ? You must set the STING.CPX to active.

That's nothing unusual. HuSHI and HDDRIVER introduced support for byte
swapping some years ago.

HiSOFT C is a interpreter not a compiler. If you wish to compile the code you
will need a compiler - eg Lattice C

Hi all.
I'm creating a "Virtual Museum of Flight Sims" at
http://www.migman.com.au/mm/simhis/simhis1.htm

and need screenshots and scans of boxtops for the
good ol' Atari versions of the same.

Used to have a couple of ST's myself, only got out
of there when they stopped having flight sims written
for them.....Atari sure led the pack for a while there
though :)

Any help would be appreciated

Um ....

Stupid Questions, these, but I must ask:

1. After you install the drive icon to your desktop, do you save the
desktop to disk with the "Save Desktop" command?

2. Do you use the ICD utility to set the boot drive to C:?

3. Is ICD's *.SYS file in the root of your boot drive?

These three things come to mind first.

Funny you should say that, according to the US Hotlines in Inter//face//
(a weekly mag. in with The Times) apparently Bill Gates decided last
week that all of its business operating software is to be renamed
"Windows 2000" and junking the Windows NT brand it has been setting up
for the last few years.

It seems M$ are not happy as IBM are are behind an initiative to make
Unix a hit on Intel servers and there is a launch of an ad campaign by
Sun Microsystems saying:

"Thinking of running your critical apps on NT? Isn't there enough world
suffering?"

>your hard drive to the new MS/MFM format that will turn a 5 gbyte

Say, isn't this stuff about running wdialog from the CNF file alll on the readme of either NAES or Wdialog or COPS ? It also states that COPS needs COPLOAD to load properly.

I did some experimenting myselfs several weeks ago. I am using the english version of wdialog (I can't remember which version) and loading it from .... the auto folder. And still COPS gets loaded correctly (via CNF file again). Weird. I guess by the time NAES gets loaded, wdialog was already ready. (another thing- NAES don't seems kick out the old system (TOS/AES/VDI or whatever part of it) like MagiC so I guess wdialog was still in memory & accessible).

Yeah, and trying oexport, etc. doesn't help either...

>Must have missed more.... I try to follow this keymap.inf information, but
>no way. BTW, I'm using 1.35B

I _think_ it might require:

*E sh oexport [parameters here]

but I don't know what parameters to try. All I get (without pars) is
the shell comes up and complains the command isn't found.

This is with:

#_ENV SHELL=C:\USER\ENGINEER\BIN\MCMD.TOS

so Okami knows how to call the shell. It won't work at all else :-}

>I added some commands to set kill flag and move on to next msg without any
>problems some time ago...
>

Some more experimentation to try with this (but I don't know when I'll
do that). So, anyone else???

Cheers,
Mish

>Has anyone any ideas?
>

I think, that you will need to make too many 'patch', actually you must
writing complete driver for VGA video card. It's not enough just writing to
screen memory, you must program card registers, video modes, refresh rate
etc.

Yes, they do. HuSHI supports DOS compatible partitions of up to 32
MByte. HDDRIVER supports larger DOS-compatible partitions if Big-DOS or
MagiC or FreeMiNT 1.15 are installed. With FreeMiNT 1.15 even
DOS-compatible FAT32 partitions are supported.

> Beside byte swap other important feature is recognize of (Big)Dos
> partitions on PC disks. And easy to use...

With the tools coming with HDDRIVER you can create media with a
partition that is both DOS and TOS compatible at the same time. I think
that is the easiest solution possible because you don't need any special
software like Big-DOS at all in order to exchange data with a PC.

Someone will have to explain to the Benhe brothers that their
Wdialog is the worst piece of code ever made.

It conflicts with so many things that it basically turns any
well-behaved system into pure Wincrap98.

Unfortunately, NVDI 5.00 refuses to boot without it.

I guess this means I'll be hunting down a copy of 4.12....

If you have true MIDI file, ie. a file with a .mid identifier, this can be run on any system; no conversion needed. Just check that your sequencer program uses the correct instrument mapping (General MIDI being the standard in most cases), and the gazillion MIDI files available in the net can be used on your Atari. Have fun!

It works here. Did you use tabs or spaces between the letter and the
command ?

I've added the following with great success:

*E export
*I import
*X expire

> Must have missed more.... I try to follow this keymap.inf information, but
> no way. BTW, I'm using 1.35B

I'm using 2.0B

You could try directly with the command line in Okami itself to now if
there is a problem with your version. Hit [Control C] and enter the
desired command.

Message-ID: <horseman-1111980943570001@slc635h.modem.xmission.com>
Source record: 90215

Hey all, I've been trying to set up STing on my TT030, and the darned thing keep crashing my system.

I run a CrazyDots 8 VME video card and NVDI for the ET4000 graphics card. I've got my modem plugged into Modem 2, the port set for 38,400 bps. As soon as the STing software goes out and takes a look at the modem (I can see the SD and RD lights flashing) the screen goes white with a bunch of black lines and garabage at the top of the screen.

If I switch the monitor over to built in TT video port I see two bombs on the screen (bus error?).

I have been running FSERIAL instead of HSModem. Could this be the problem? Or is there just some basic incompatibility between NVDI and STing?

Any suggestions?

Also, could someone point me to a good archive of Atari software on the net somewhere? I used to hit the FTP server at atari.archive.umich.edu, but it doesn't seem to be responding anymore.

Thanks!

Yup. I've heard rumours that the next N.AES-version will include all
MagiC-specific objects (frames, underlines, checkboxes etc), let's
hope they implement the wdial*-calls as well.

> Unfortunately, NVDI 5.00 refuses to boot without it.

Not really correct, it will boot and work fine but you can't
configure it...

If you have NVDI 5 and a compatible graphics-card (basically any
ET4000-based cards) this should be possible. I don't know when MagiC
started supporting this, but I believe you need a fairly recent
version.

>*X expire
>
>> Must have missed more.... I try to follow this keymap.inf information, but
>> no way. BTW, I'm using 1.35B
>
>I'm using 2.0B
>
Good you mentioned that one. I am now. The commands do work now. The
defined keystrokes do work now. How come they were mentioned in an old
Keymap.inf for 1.34 and didn't work there, or in 1.35B??????

>You could try directly with the command line in Okami itself to now if
>there is a problem with your version. Hit [Control C] and enter the
>desired command.
>
Won't work in my 1.35B either: same result, a box saying "unknown command".
Only works in 2.0B.....

Gotta read the 2.0Beta text now for more info. This box poppin' up is
p.... me off.

BUT it sure as hell beats me how it is possible it's being mentioned in
docs for 1.34 and 1.35 and won't work there....

>Try http://www.hisoft.co.uk/atari/

this is the lattice c compiler, which is fine, & will work on an 030.
but it does not have a source level debugger. would anyone use a compiler
without a source level debugger?

the old prospero c (given away free on a cover disk once) works fine for
a standard atari & has debugger. i know someone who did a 1 meg PhD C
program using this!

Why on earth would you want a feature like that? Much better with C
where you have to wait for it to compile all the source modules and
link them. Only then do you get:

[linker]: 'PRNT': unresolved external.

Much more fun! [??!!] ;-)

>Anyone know what this v.90 is?

A pita just atm. There are/were two different 56K connection methods competing with each other to become 'V90'. For this reason almost all modem manufacturers provided flash-upgradable modems, it being very unlikely that either method would be exactly supported by V90. If you've got one of those modems go should go download the Mac/PC upgrade software ... ;-(

If you haven't one of these modems it shouldn't affect you. Nothing's perfect though. I have, and I've upgraded to V90 and I'm having the odd problem connecting. Most likely this is an issue concerning the new hardware & software at the ISP end.

Essentially, it's probably the same for you, reguardless of your modem. If it doesn't sort itself out pretty quickly, start moaning at them!

I used to do this on my TT under TOS. In sixteen colour mode (TT med.) I would just use the colour .CPX to make black white and white black, and leave the other colours alone. This had the added benefit of turning the white border that is displayed on an SVGA monitor in TT medium, to turn black - so you have a smaller display area hovering in the middle of the screen - hey, just like an ST and SM124!

When I moved up to Magic/Thing, I changed back, since I like the colour icons, however. I live with the border.

Yes, BubbleGEM works as an accessory in single Tos. Though there is no
entry, it's the only way to run it in plain Tos.

>Can they be used in Mega ST?

Yes, it can. The 4 meg Mega 2 I use had one installed when I
bought it. I have since removed it since I just don't do
enough things with internal sound, and I probably need a driver
to let stuff use or the stuff is especially aware of the
tweety.

Er, I don't know what csap is. I was just wondering if anyone has had any
experience compiling files created with HiSoft C (for the Atari). I understand
that Lattice C will compile those files for you, but I'm not sure I can afford
to get it right now. :(

Louis,

Thanks for your reply. Yes it's the Intel 82786 chip. I have NVDI 5,
it just came yesterday and will install it soon. NVDI 5 supports Matrix
TC and CX cards. Is the Coco a CX card? The NVDI documentation is
silent on this. If this is not the case then I will need to get a driver.

My primary use for this board will be surfing the net with cab 2.5,
soon to be 2.7 I hope.

Hi all,

I have been having some problems that sound similar to yours. Slow response, CAB timeouts and ending up with half a web page. While you are online open tools on your Sting Dialer, select statistics, click on the ICMP box then select TCP. See if you have a lot of dropped datagrams. You should expect to get some say 20 to 40 depending how long you've been online, but if they are in the hundreds then the data is corrupt at the TCP level. TCP does not NAK bad messages, it just does not ACK and drops the message. Your host server has a timer, when it times out it resends the message. This continues until CAB times out or good messages come in. This is usually caused by a bad phone line.

My Supra modem has a display that reports transmission errors, retrains and other anomallies that I normally associate with poor line connections. It did not show any troubles.

Listen to your phone line, I mean really listen. Pick up that hand set and hear that dial tone, is it strong and steady? Mine wasn't. poke a key so the dial tone stops. listen again, is it quiet? no hiss, no pops, good. Modems are picky about those things and the faster you go the picker they get.

Hello All:

This might seem like a silly question..but I was wondering if there were any Atari users who use INVERSE VIDEO, that is a dark desktop with light fonts. I find that most applications stand out more using inverse video. For example "Sweet 16 " (the midi sequencer from Roni Music). Without inverse video, the graphics are very mediocre..not much to look at. Inverse your video scheme and WOOAH..it looks real sharp ! perhaps there are Atarians out there who don't know this "trick" for a cooler looking desktop and graphics when running applications. Of course, this is just my opinion. Perhaps some people Prefer the normal way for readabilty. Comments?

Mish, it WAS in the KEYMAP.INF for 1.35B, and I seem to recall also in the
same file for 1.34...
Got an e-mail from Jos, where he said "he thought he had written the code
some time ago but maybe he hadn't recompiled. Or it could be in a newer
version of 1.35B" (so appearently there are different ones?)

Anyway, it's working in 2.0B, gonna register that one ASAP since the
poppin' box irritates a lot :-)

Mitch,

I'll prepare an e-mail tonite with the drivers for it, haven't got time
now. Don't have much docs on these, but I suggest you start up with only
these files and try to get it working. Once it runs, you could try to
install NVDI 5, but if these are not OK, NVDI will very likely NOT install.
You're stuck with AMC-GDOS then :-(
I got an e-mail from David Leaver from Down Under where he says he never
managed to get the CoCo run on his TT. It does from his STE though...

Mike,

OLGA = Object Linking GEM Applications... another add-on for a more
comfortable OS.
BubbleGem = small helpfiles. When installed and supported by the program,
usually a rightclick with the mouse on items will pop up information in
"balloons" (like the cartoon things). Or: explanation on the spot. Comes
in quite handy sometimes, where ST-Guide always needs to be started first
and the program screens are overwritten by the ST-Guide screen.
Especially under MagiC those apps are quite nice.

Tim,

I think that's OK on monochrome screens. I used to run Protext like that
years ago on my ST, it was a built-in feature. Made it easier to stare at
the screen for longer periods.
I prefer to have my backgrounds in light greyish tints since I'm working
TC, but not very many programs support that. Thing does, and so does
MyMail. ST-Guide has such an option. I wish I could do it with QED and
lotsa other apps... :-)

No need for conversion. MIDI is MIDI, whatever platform you're
considering.

> PC can't read Atari floppies and vice versa ....

Assuming you are using 720K DSDD floppies and your ST has at least a
double-sided drive, then the Atari should be able to read and write PC
MS-DOS formatted floppies. The other way round is not 100%.

If you definitely can't get the file transfer to work, connect your 2
machines through MIDI, (OUT to IN, IN to OUT), fire up sequencers on
both machines, play the midifile on the ST, and record it simultaneously
on the PC. Remember to sync the PC sequencer to external MIDI.

>
Hi Mitchell,

Matrix doesn't support their Graphic Cards any longer. I used a Coco sometime ago but changed it to a CRAZY DOTS VME II because:

- Drivers aren't stable with Magic (with Matrix NVDI 2.50)
- Many Apps won't work
- Coco is slow in 256c- Mode
- Coco doesn't support high resolutions (e.g. 1024x768 /256c)

But, nevertheless, you'll have colurs...much better then TT-high (880x660 at 16coulors, 72Hz works great). CAB will work, but icons in CAB look ugly (use text). And with CXXSETUP, you can use almost any monitor.

Use REDIRECT.PRG as first prog in AUTO to see what's going on while booting...

2670. FS (UK): Lattice C 5.52

Newsgroup: comp.sys.atari.st
Date: 1998-11-12 00:00:00 UTC
From: Michael Clemmetsen <mc@syn.beetee.co.uk>
Message-ID: <72eari$1j6$1@pheidippides.axion.bt.co.uk>
Source record: 90117
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

Hello,

I have HiSoft Lattice C 5.52 for sale for 20ukp including p&p.

The package includes the following:

Original disks (in HiSoft disk wallet!), manuals and box.

The software comprises the Lattice C compiler, assembler and linker which can all be accessed transparently from the integrated development environment*, a complete set of libraries for writing GEM applications and the WERCS resource construction set. A single setup program installs all the different components into the right places on your hard drive - you can go from opening the box to compiling your first program in about 30 minutes.

The manuals comprise the library documentation for Lattice C 5, an addendum for Lattice C 5.5, a user guide to the editor and IDE and an installation and getting started guide which includes a quick tutorial. They are in good condition.

The box is, ehrmm box shaped - a bit like the type of box you would get a pair of Dr Martens shoes in, with a printed card sleeve describing Lattice C. The sleeve is a little sun light faded on one side.

I would prefer to sell in the UK as it is easier to sort out the money and the p&p is cheaper, but if you live elsewhere and can suggest a means of payment please get in touch.

That's all,

Michael
--
To send me an email substitute @ for % in this address:
michael.clemmetsen%syntegra.bt.co.uk

* Note that the IDE does not work very well on the Falcon - if you have a Falcon I would recomend getting Lattice C 5.6 direct from HiSoft, since 5.6 includes Falcon support. However if you have an ST(e) then this is an ideal opportunity to get a complete development kit for the Atari. I bought Lattice C 5.52 when I had a Mega ST and am selling it now that I have moved to a Falcon.

Source record: 90119

Is that a joke ? Or do you really mean that browsing with a STe is a good idea ?

I DO browse sometimes with my STe, since I don't have (and don't want to have) any PC at home. And I can tell you that browsing with CAB 1.5 (no frames, no javascript, and some oddities with HTML forms) in 320x200 16 colours or 640x200 4 colours (or even 640x400 monochrome) when now every new web site is designed for at least a 800x600 HTML 3.2 client is definitely not the best solution ever.

Let's be clear :
- you can graphically browse with a simple STe, but
- you will only display monochrome IMGs and
- a 8MHz 68000 takes time to display any IMG so that a graphic www page can takes up to minutes to be entirely displayed.
- and the STe serial port can only speed up to 19200bps (remember new modems : 56000bps).

So, browsing with an STE is alright if :
- you plug a graphic card in it
- you release the CPU to at least a 68030
- you release the serial port.
It might be cheaper to buy a Falcon or a Milan...

But on the other hand, it's a quite good way to mail and access news.

By the way, where OKAMI's homepage ? I'd like to test it...

2674. original Ocean software illustrations

Newsgroup: comp.sys.atari.st
Date: 1998-11-12 00:00:00 UTC
From: retrogamer@hotmail.com
Message-ID: <72elkq$o9d$1@nnrp1.dejanews.com>
Source record: 90121

Bob Wakelin is the artist who illustrated nearly all the covers for Ocean software between 1983 and 1994.

His work includes the covers for Rainbow Islands, Cavelon, Eskimo Eddie, Mutants, Parasol Stars, Shadow Warriors, Rastan, Frankie goes to Hollywood, The New Zealand Story, Hyper Sports, Pang, Where Time Stood Still, Moon Alert, Operation Thunderbolt and Target Renegade.

Now he is selling the original one of a kind artwork for selected titles. Details (and about 30 box scans) can be found at:

http://retrogamer.merseyworld.com/wakelin.htm

Prices start from 50 pounds for a slice of history. Several of these illustrations have now been sold to readers of the various game newsgroups but there are many classics still available.

An interview with Bob Wakelin can be found in the current issue of RETROGAMER fanzine (number 18).

Thanks for reading,

Yeah, I know it's difficult a bit, but not impossible. Besides:
1. I plan to use max 2 video modes (the most useful ones) offered by the
card;
2. As I mentioned earlier, the easiest way would be to set the screen
memory address to a card memo addr, but I'm not sure whether it can be
done: VME addresses are > $Fe000000 or so.
Well, but does anybody know anything of the REFRESH signal?

Chris

Krzystztof,

I'm afraid both apps (OLGA and Bubble) need a multitasking environment.
They are started at boot-time from MagiC (or Multitos etc) and AFAIK
Bubble doesn't work as an ACC. Don't know where english docs for Bubble
are available, but maybe someone might jump in...

2686. Cubase Audio and Standard Midi Files

Newsgroup: comp.sys.atari.st
Date: 1998-11-12 00:00:00 UTC
From: BushMan <sbushman@gate.net>
Message-ID: <364B14E0.1C1E@gate.net>
Source record: 90133

I am trying to use some standard midi files form a Roland JW-50 with Cubase Audio for Atari Falcon. My sound module is a Roland CM-64 (just like an MT-32 but with a PCM module added), however the files were produced using the JW-50 sounds. When I open the file directly in Cubase, i get a single midi track (set to all in channel) which does not play back properly. In fact, one sequence only had drums...the base and strings were gone.

I also tried playing the sequence from the JW-50's internal sequencer, and ran midi out into the Falcon. Agin, I hear something that is similar to my sequence, but the sounds are ALL wrong.

Being that I have a Roland sound module (with both LA and PCM sounds) I am sure I have all of the right sounds...how can I get these files to play properly.

Again, when i load file straight into cubase all i see is one track, and I can't make sense of it. I can only assign that track to one channel so I only have drums, or one instrument that is tapping the drum beat.

Any help would be greatly appreciated, and would save me 2 of 8 audio tracks (which would be stellar!)

Thanks in advance!
Shane

Why not go to http://www.digital-arts.ca/atari and download the demo? Try for
yourself is what I always say...

Personally, I prefer Layout to Calamus SL for posters and advertisements, it
has much better vector drawing tools and support PostScript output...

>
>
>Mitch
>mbenedet@mosquitonet.com
>
Hi Mitchell,

the e-mail with the drivers file was bounced...! Used the ads mentioned
here, so don't know what's wrong with it.
Anyway, I just put up page nr. 2 on my site

<SILENT MODE ON!>

check out http://www.holleman.demon.nl/matrix/
and you'll come across a file MATRIX.LZH grab that one and try it with
your card. Let me know how it turns out, please.

<SILENT MODE OFF>

Note that in ANY case you need to install these drivers FIRST! Only after
you get the stuff up and running and all the settings to your liking,
start installing NVDI! It won't install without the Matrix software,
unless you want an installation for a partition running in TT modes!

Best way is starting with only the Matrix stuff, no other autofolder
programs, which means using the Autofolder from the archive.

If you run into trouble, either contact me again or David Leaver, e-mail
leaver@alphalink.com.au who owns a CoCo too.

I also got trouble with version 2. But somehow connected with NVDI
version 5.
Now I start Wdialog from the N.AES cnf file and the machine mentions
me:
AES already present
WDialog installed.

Also looking at processes it is there but with the flag 'h'.
Anyone knows what that means?

May be, but my N.AES disk had read errors in the doc part.
being not so stupid I managed to get it running in a way...
Now I have a new version but the disk has a read-error in the rerally
important parts.
Because there is a free update for me announced in the German news
I wait for the snail-mail to deliver a readable disk.
(I tried out 5 different floppydrives: it really is the soddy quality
of the disks they use.)
>
>I did some experimenting myselfs several weeks ago. I am using the english
>version of wdialog (I can't remember which version) and loading it from
>..... the auto folder. And still COPS gets loaded correctly (via CNF file
>again). Weird.

Weird????
With N.AES 1.0.0 and Wdialog (1.95) in the Auto-folder I had a stable
system with NVDI 4.1.
I am going back to it!!!!

>I guess by the time NAES gets loaded, wdialog was already >ready. (

I have it the other way around:
I get the message: AES already loaded, Wdialog installed.
(Wdialog last in naes.cnf (run...)

Can anyone help with what sounds like a virus problem please. A local
school has an Atari (not sure which model) which is used for music.
Whenever it is
activated, bombs appear on the screen and any work the students try to do is
lost.

Could this be some kind of virus and if so, how can it be safely removed -
there is a lot of student work at stake.

Many thanks for your help,
PG

2700. Saga of PTW.COM

Well, today before 8am I got onto my ips's SLOW line and did my D/L'ing of messages and such. After 9am I have totaly been unable to hookup with PTW.COM (Networkone).So to see if I could maybe do a bit of debuging, I fired up Flash 1.6 and logged on. 1st thing I find, instead of saying login: it now reads Login: and I had not been able to get past that part. So I change the STinG dial script from login: to Login:, Bingo (Almost!), I can get past the password section, but then the DNS numbers were way off base.

So I called them up and they gave me their new numbers and once more I adjust the dial script. Now it gets past the connection part and then it goes to Init the link ... NO WAY! So I've called them up and they'll talk to the guy who knowns their new boxs (running W98 'YUK') and see if their can figure out how to get me online.

Ofcourse, you'll not be reading this until I do get back online.

Basically you treat the ftp directory window as a disk directory so you can
drag files to and fro etc etc, usual alternative OS required etc for this to
work.

> BTW, how am I doing on my articles for AC? Do you like them, or

2712. Help! Midi file changes in Cubase Falcon!

Newsgroup: comp.sys.atari.st
Date: 1998-11-13 00:00:00 UTC
From: BushMan <sbushman@gate.net>
Message-ID: <364BAE40.7591@gate.net>
Source record: 90056

I have been trying to import Standard Midi data into Cubase Audio Falcon. After doing so, I choose to remix the tracks and I can seemingly reset the sounds so that they correlate with MY sound module (as opposed to the JW 50 which they were sequenced on). I get everything sounding great, and every measure or so the presets change to the number that they would have been on the JW-50 (which don't match with my Roland CM64, so i get garbage!).

How can I make Cubase keep the new sound setting...and stop resetting back to the damn JW-50 preset #?

I appreciate your help greatly!

Thanks,
Shane

Danke fuer informationen. Maybe you could put info about it on your WEB
site. Support for FAT32 is not so depend on driver, how on DOS (TOS)
extender. Driver should only support very large partitions. And Atari should
have lot of RAM, probably.

>> Beside byte swap other important feature is recognize of (Big)Dos
>> partitions on PC disks. And easy to use...
>
>With the tools coming with HDDRIVER you can create media with a
>partition that is both DOS and TOS compatible at the same time. I think
>that is the easiest solution possible because you don't need any special
>software like Big-DOS at all in order to exchange data with a PC.

Well, as I tested HDDRIVER, it recognizes only one DOS partition, while
IDEPC - test version recognizes up to four partitions , also extended DOS
partitions (and I could easy increase this count). Other thing is that with
HDDRIVER user must modify driver for each hard disk with HDDRUTIL, saving it
to boot disk, restart etc.
My goal, when I wrote IDEPC was maximum easy usage of IDE hard disks
partitioned and formatted (and used) on PC.
This means: connect drive to Atari's IDE port, booting with BIGDOS and IDEPC
in AUTO folder of boot disk - and that's all.
Fortunately special software BIGDOS is free (danke Reiner) . And
partitions with large sectors are not so efficient like BigDOS partitions.
I prepare program for IDE disk partition - it should be very flexible, and
with mouse control of partitions size and position. And first version will
use PC partition system - why not be compatible with far most used system in
the World ?
And one thing more: IDEPC works with Western Digital drives too.

Whit all this, I didn't wanted claim, that my program is better than
HDDRIVER. HDDRIVER is versatile driver, which can handle lot of diverse
storage devices, while IDEPC is IDE hard disk only oriented.

Pera

2714. Who else used Falcons?....

Shane:

It looks like you are dealing with a "Type 0 " Midi File . It is all
the midi channels crammed into one track. Instead of assigning it to
one midi channel, choose ANY. Then all the midi channels will play.
Also..the midi files could be in GM format, so you need to have your
synth set up for GM playback. You could also UNMIX the track. Look for
that option on the menu, or look it up in the manual.This will spread
out the channels seperatly like a TYPE 1 Midi File.Then you can go
into the list editor and see what the patch change numbers are, and
change them to what you want or need.

I hope this helps!

Bad sectors are most likely not an SCSI bus problem but indicate a
broken drive. You can check this quite easily with programs (HDDRUTIL(
that not only support a sector tests but can also display the SCSI error
code in case a read error occurs. With this error code you can
definititely decide if a sector is bad.

Pera Putnik wrote:

> Danke fuer informationen. Maybe you could put info about it on your WEB

I can't put any more details on my site. There are lots of other things
built-in in HDDRIVER that I can't mention because most users wouldn't
know what this means and because it would take several web pages. When I
say that I support DOS compatible media the user can expect that this
simply works with all DOS media he tries. HDDRIVER will take care of
everything that is required.

> site. Support for FAT32 is not so depend on driver, how on DOS (TOS)

If you have a DOS compatible FAT32 paritition and your hard disk driver
doesn't recognize the DOS F32 partition type I don't think you can use
these partitions.

> Well, as I tested HDDRIVER, it recognizes only one DOS partition,

HDDRIVER supports as many DOS partitions as TOS partitions are possible.
It supports standard and extended DOS partitions as well as FAT32 DOS
partitions. Lots of users use it for the purpose of data exchange.

> partitions (and I could easy increase this count). Other thing is that with
> HDDRIVER user must modify driver for each hard disk with HDDRUTIL, saving it
> to boot disk, restart etc.

You already told me that you don't have access to a legal copy of
HDDRIVER. So I don't think you should tell such a nonsense here. Buy a
legal copy of HDDRIVER so that you can read the manual and see what has
to be done and what not. Usually you don't need any boot floppy at all.

> partitions with large sectors are not so efficient like BigDOS partitions.

Big-DOS doesn't have special partitions. You can either have DOS or TOS
compatible partitions (or partitions that are both). It doesn't really
matter if you have small sectors and several sectors per cluster (like
with DOS) or large sectors and only 2 sectors per cluster (TOS). After
all cluster sizes are the same.

>And one thing more: IDEPC works with Western Digital drives too.

HDDRIVER also does. For a few drives you have to create a boot disk but
these are exceptions to the rule and every driver is affected in this
case. Katherine, if you're reading this please tell Pera that you don't
need a boot floppy for your WD drive. Pera doesn't want to believe me
:-).

> Whit all this, I didn't wanted claim, that my program is better than

I also didn't say that your program is bad. But you told us about unique features of your software that are not unique at all but have been supported by other drivers like HuSHI and HDDRIVER for years. I think you should be more careful in saying that your software can do things other software can't. So far you always have been wrong and I don't think that this leaves a good impression.

><SILENT MODE OFF>
>
Well, this site has been updated once again! Note that it isn't accessible
from my main page, but for the time being only by feeding CAB the right
URL. Going from there to my main page is no problem, though.

What can be found there?

- Software to operate C32/C110/C110Z/MoCo/CoCo/MiCo cards
- A textfile how to use this software
- Software to operate TC1006 and TC1208 cards
- The latest Matrix upgrade software for TC1208/1208E cards
- A textfile with notes how to install NVDI with TC1208/1208E cards
- A textfile with technical notes on the C32/C110/C110Z/MoCo/CoCo and
MiCo cards.

It is my understanding that Martin-Eric Racine has put similar stuff onto
his TT support site.

If people have additional info/software regarding Matrix cards, I'd be
glad to hear from them.

All this for the benefit of those, who buy secondhand Matrixcards with no
software (and appearently this happens a lot!).

I use inverse on a TT with VCONS in ST High Res. Also on attached
terminals. Much easier on the eyes after 10 or 12 hours in front of
the dam things. Its definatly easier than color.
Under flourecent lighting, if you stand back about 20 feet and look
at you monitors with color vs black and white, you will see what I
mean. The color screen flickers just like computer screens on TV.
You seem to see every refresh. Mono Chrome inverse does not do this.

2726. Matrix cards support, was Re: Matrix coco

Newsgroup: comp.sys.atari.st
Date: 1998-11-13 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <364c2c6eb73d3500@holleman.demon.nl>
Source record: 90070

To all Matrix lovers,

Just finished a phone conversation with Matrix Vision in Germany, in which Matrix said to have no objections against me putting up a support site on the Net for their former graphics cards.
(As long as I won't write negative stuff about the cards...!)

This means a few things:

- A link has been established on my main page to the Matrix page
- The software put up there, is now legally put up there (!)
- Anyone, who can contribute to additional info or software, is hereby invited to do so (e-mail address in the sig)

Matrix themselves have nothing left on their previous products, so don't go ask them for software or hardware. Just too bad, but that's the situation.

Bonjour,

Dans son message ï¿½ï¿½Re: DTP> Calamus Vs. D.A. Layout???ï¿½ï¿½,
energized@my-dejanews.com a ï¿½critï¿½:

ï¿½ï¿½Why not go to http://www.digital-arts.ca/atari and download the demo? Try for
ï¿½ï¿½yourself is what I always say...

And to http://www.calamus.net for Calamus SL 98 demo... You'll have
everything to compare.

ï¿½ï¿½Personally, I prefer Layout to Calamus SL for posters and advertisements, it
ï¿½ï¿½has much better vector drawing tools and support PostScript output...

Calamus can handle PS output with either Bridge or Adequate Systems'
PS printer driver (the last one only in B&W or one image / plane, for
flashing). The second one works very wellï¿½; I never tried Bridge.

Just my $0.02 worth....
While more "recent" versions of TOS are PC friendly (see below :) there are a couple of RAMdisk utilities that break this. Maxidisk is one of these. I think it modifies the drive parameter table or something. I haven't tried this under TOS 2.06, only 1.xx on my STe. You can still read and write to a PC formatted floppy though.

Ah, this discussion seems to never will end... I try to be shortest
possible.

Recognize partition type is very simple... Other is up to Mint :-) .
I downloaded FreeMint 1.15, and I will test driver with him soon.

>... Buy a legal copy of HDDRIVER so that you can read the manual and see
what has
>to be done and what not. Usually you don't need any boot floppy at all.

Sorry, I will not pay 60 DEM for just testing your software. As I
mentioned, demo is too limited, and it is impossible checking most of
features. It looks that all 6 IDE drives, with which I tested HDDRIVER are
unusual.
I don't see, how boot from PC hard disk - no need for floppy only if you
have other hard disk connected to Atari.
>
>>And one thing more: IDEPC works with Western Digital drives too.
>
>HDDRIVER also does. For a few drives you have to create a boot disk but

>need a boot floppy for your WD drive. Pera doesn't want to believe me
>:-).

>
See 'preinst.txt' from archive AT_BUS.LZH from Hans-Dieter Jankowski
(year1993.) .
Actually HDDRIVER misses same thing like TOS 2.06, initialization of drive
parameters. Main problem is TOS - when it can't read MBR, no autoboot from
IDE disk is possible.
But if you already boot from floppy, or other hard disk, why not implement
this simple initialization in driver ?
I tested only with 2 WD drive models, of course it's possible that there
are models, which doesn't require initialization. Couple people also
informed me, that they couldn't work with WD drives via HDDRIVER.
And I'm very suspicious, and believe only in that, what I checked...

>But you told us about unique features of your software that are not unique
>at all but have been supported by other drivers like HuSHI and HDDRIVER for
years. I think

>

Well, well, well. Please point to MY message or WEB site, where I wrote
something like that.
You should know, who wrote it, just look up in this discussion 'tree'.
It's not my fault, that people (and myself) is not enough informed about
features of HuSHI (I even doesn't saw WEB site about it) and HDDRIVER.

Pera

laurent Courneil a ï¿½crit:
>
> What should I look for to upgrade my 1040ST to higher memory.
>

ST, STF or STE ?

If it's an STE, then it is upgradeable with 30 pin SIMMs.

If not, then you'll need to get a memory upgrade board, or to do a LOT
of soldering.

1040 ST or STF are only made to support up to 1Mb of memory anyway.

> I have 2 1040ST, can I have 2 Mb memory for one ST ?

No. Again, if you mean soldering the RAM from one ST/STF into another,
then there's no more room on the board. You need an upgrade board to go
beyond the 1Mb limit.

If it's an STE, then the answer is also no, because 1040s were fitted
with 4x256Kb, so the sockets are already filled up. You need 1Mb SIMMs
to go beyond that.

>
> Where is the memory ?

Erm... on the board ?

This is all in the Quick FAQ:

http://quickfaq.atari.org
or

I now decided to buy the iomega ZIP drive, SCSI version
(thanks for all tips, I didn't want to buy Syquest because I've heard
that they have troubles).

Now I want to read/write DOS formatted and partitioned ZIP discs on my
ATARI (actually I write to the disc also with mtools on a SUN).

I read through the news in DejaNews and nearly everybody suggests HDDRIVER.
So I got the demo version of HDDRIVER 7.6 yesterday.

But in the "readme" it says:

"[...]

NOTE:
Drives that were partitioned with very old versions of the ICD hard disk
software are not AHDI compatible if they have more then 4 partitions.
In this case the installation of an AHDI compatible driver requires
repartitioning your drive with an AHDI compatible software package or
converting the existing partitioning scheme to an AHDI compatible scheme
with ICD2AHDI."

Now, that's not very helpful: which versions of ICD software do they
mean?
"Old versions" is a bit vague...

Is the following software from ICD
HDUTIL Version 5.13
and
ICDBOOT Version 6.5.5
ok?

Problem with the demo is that it is VERY restricted.
I have more than 4 HD partitions and so I didn't wonder
that the HDDRIVER demo could find my ZIP drive on SCSI but couldn't
address it with a DOS zip-disc in it(no read).

Otoh I don't want to repartition and buy HDDRIVER now because
I couldn't test it.

Any other tools to simply read or write from/to DOS
formatted/partitioned ZIP discs via SCSI?

Thanks in advance
ME

It's a long time since I've used HiSoft C, but I think it tokenizes the
.C/.H files. If it does, you'll have to load them into the editor and
save them out as plain text.

I also did not get it stable.
Even Wdialog started via naes.cnf did not work.
I updated NVDI from 2.5 to 5 (payed for it!)
I 'borrowed' a 4.12 from a friend and have that one stable with
Wdialog 1.95.

Is it illegal to own a version 5 but using an old 4 from someone else?

You may not need to.

Re:
>> >Has anybody compiled code
>> >using HiSoft C?

No, but I did have a quick look at a cover disk version of Hisoft C a
long while ago. I have a vague recollection it contains non standard
functions?

>> >For some reason, my Laser C doesn't like one of the files
>> >that came with HiSoft C that you have to compile first and I don't know how
>> >to change so that it will work.

Is Laser K&R or ANSI? [see below]

Is Hisoft K&R or ANSI? [I'm almost certain it's ANSI]

>> >Any advice would be appreciated.

It might be as simple as this: the hisoft supplied source file is ANSI
whereas Laser is K&R. Type this into Laser and have it compile it ...

```
/* ANSI syntax */
int
main(int argc, char **argv)
{
return 0;
}
```

... if Laser fails on the above try it thus ...

```
/* K&R syntax */
int
main(argc,argv)
int argc;
char **argv;
{
return 0;
}
```

... which *will* work. Now have a look in the hisoft supplied source code and see which of the two methods is used to define functions. Another way to tell is by looking at the function prototypes in header files.

```
int foo(int,char); /* ANSI */
int foo(int somevar,char anothervar); /* ANSI */
int foo(); /* K&R */
```

That's my best guess atm - more details (error messages) will help of course! <g>

Hi

> Is there any Fax Software for TOS machines anymore?

Yes.

> I remember something called ST Fax that had drivers for the most
> popular atari documents, such as PageStream, AtariWorks, etc...

I don't know about that one.

> Is it possible to buy that package still?
> Any alternatives still on the market?

I have Junior Office I can get it to send Faxes OK, but havn't been able
to
get it to recieve them yet, some otheres have though, and from what i
can
figger out about JO is that its one of those programs that you can
either get
to work or not on some machines.

|>.
|I think all the TOS 1.4 Megas had a blitter. Not sure about the earlier
|ones. I have two Megas with TOS 1.4 that have a blitter.
|.

Things get a little hazy with the passage of time but I know that my first Mega ST did not come with a blitter as it had to be installed later. I think this was because Atari did not have the blitter ready, but there was a slot for it on the board and when it was installed the menu entry to switch it on and off appeared automatically. I think this was a 1.2 TOS because I remember upgrading to a 1.4 some time after that.

I seemed to miss out by buying my machines too early. The blitter and the 1.2 TOS on the Megas, and DD drives instead of HD drives on my TT and a Mega STE that I obtained for someone else. (Not to speak of the brick PSU and external drives of the original ST.) However, I enjoyed them then and continue to do so now.

2748. FS: CLAB Falcon +++

Newsgroup: comp.sys.atari.st
Date: 1998-11-13 00:00:00 UTC
From: scarlet.squirrel@usa.net
Message-ID: <MPG.10b66e67baf73f60989685@news>
Source record: 90092

Forsale:

CLAB Falcon TOS 4.04
-Blowup FX installed with audio mods done*
-850meg SCSI drive (Quantum)
-RGB & VGA adaptors
-14.4 Modem
-14 megs of ram.

Alot of disks (most with software on them, lots of software on the
hard drive including Atari Works and NVDI 4 (Original))

$350.00 including shipping to Canada or USA.

*blowup-FX audio mods are done but may still be able to use some
of the other mods. CPU accelleration is not always stable though extra
memory and extrended resolutions run fine.

For $100 more I will also include Cubase Audio Falcon including
all disks, manuals and the dongle.

Well last night I tried to figure out why I couldn't get connected to my isp via two numbers. I edited the script at lest 3 times. I putin the new dns numbers (209.144.112.4 / 209.144.122.6), they said to leave the hostname blank, so I did.

Oh BTW, how do I get STinG to write the debug trace without it crashing my TT? Do I need a file name and if so Where do I put it? I've got until the 20th to figure this out or it'll be offline time for me.

One thing you could try it to add the following at the beginning of the
files:

extern LONG clear_window();

I've used it Sozobon C (yes I still use that for programming) to get
funtion pointers for atexit() and I can't see why it wouldn't work with
other C compilers.

It probably (I think) tells the compiler the function is not in the bit of
code you're compiling, and that it returns a LONG value. Of course, when
it finds in the code it's compiling, it ignores the 'extern' and compiles
it correctly. As I said, I use Sozobon and it works with that but YMMV.

2757. ROM-port extension

Newsgroup: comp.sys.atari.st
Date: 1998-11-14 00:00:00 UTC
From: atarist@xs4all.nl
Message-ID: <72kk90$51n$1@news2.xs4all.nl>
Source record: 89952

Looking in old boxes I found:

ROM-Port extender.
A flatcable with on one side a plug (a small board with the
connections in the right place) that goes into the ROM-port and om
the other side a ROM-port plug.
The flat-cable is about 40 cm long, mostly to long for the systembus
to carry. But you can shorten it easyly.

They go away for 'cost of production'.

Send me an e-mail

Met vriendelijke groet,
Ronald van der Kamp

I don't think ST-Fax is supported anymore.

> Any alternatives still on the market?

Yes, CoMa, STarCall and Junior/TeleOffice. I haven't tried the two
first, but I use Junior Office for sending the odd fax. It receives
faxes without problems as well.

Junior Office is available for free, it's "big brother" TeleOffice is
commercial but I don't know what it costs or where you can get it.
However, NVDI has drivers for TeleOffice so you can fax directly from
any program that can print via GDOS. This alone makes it the best
package available IMO.

2762. Atari STf 4 sale

Newsgroup: comp.sys.atari.st
Date: 1998-11-14 00:00:00 UTC
From: hugodiaz@my-dejanews.com
Message-ID: <72ks15tjp1@nnrp1.dejanews.com>
Source record: 89957

I have a Atari STf for sale. It has the standard 4 megs of memory, TOS 1.04, and serial port modification wich allows it to use a 33.6Kbps modem. I'll include the mouse and everything else I can find. It will be sent by Parcel Post or Priority Mail from ZIP 78557 in Texas. And I can only accept Postal Money Orders. It is ad to sell my last Atari computer, but I do not use it anymore, and I think that it will be for the best to sell it to someone that it will use it. Please send *reasonable* offers to my e-mail address: hugodiaz@my-dejanews.com , and thank you for your time.

Hugo Diaz

> this is kind of a stupid question but, what is genlock and how does it relate
> to the Falcon?

A genlock (or genlocking device) synchronises the video output of the computer with a.n.other video source, so that they can be mixed. The typical use is for overlaying titles onto home videos.

Genlocks were available for the ST and also for the Falcon (I think it's called Graffiti), and if you look through computer catalogues you will also find PC ones, although in theory they should also work with Ataris as they require no software and have VGA input.

The Falcon has a special video mode called "overlay" which allows you to set aside one bit of each pixel to determine whether it is "transparent" or not, i.e. allows the incoming video picture to be displayed underneath it. I don't know if Graffiti takes advantage of that or whether it's just a generic video genlock. Does anybody know if there is any software or hardware that *has* used the Falcon's overlay mode?

Generally all you need to do to make ST disks readable on a PC is to write the boot sectors to the disk. I believe the later versions of DC-Formatter from Double-Click software (these were (are?) shareware as I remember) could do this. Alternately if you have access to the PC, you can format a DS/DD (note the Double Density) disk at a PC standard 720K. This disk should be readable on the ST. I'm not certain that this always works, because of the differences in PC hardware, but it has worked well for me.

Absolutely right. I remember a _VERY_ cool design: black (or was it dark grey?) outside, and yellow keys! Absolutely brilliant. But I think they finally didnt use these colors because of compatibility with the existing atari products. If they had only known, that even with standard design they wouldnt make it :(

Bye, MC.

IIRC that option is named "remix" ? And remember to adjust pointers
in the beginning and end of file or remixing will process only part
between pointers ...

The Stacy is rather hungry for energy. I used to have a real nice nickel-hydride (expensive) battery that provided about two hours of charge. Then I went to the Best Electronics battery and was disappointed with under a half hour per charge! Best claims that that is the best they can do. Now I use an external sealed battery pack running at 14.1 V. However, I have tested the STacy at 12 V and she works fine. My recommendation: Get a 12 V power pack of any type and make your own cable (very easy to do) to attach it to the STacy. On a wheelchair battery (about 10 KG of mass) I can get 20 hours per charge!

Indeed, I have been collecting drivers for various TT graphic cards,
all of which will eventually be uploaded to the TT Homepage.

I've noticed from various posts here that many people buy second-hand
CaTTamaran and graphic cards without any instalation instructions or
undocumented drivers.

The remaining part is, whenever possible, to obtain permission from
each authors to release the drivers for their previous products...

On Fri, 13 Nov 1998, Louis wrote:

Ah, I see. I guess my questions would be more appropriate for that newsgroup. Unfortunately, the news service I use (Dejanews) doesn't have that newsgroup listed as one that I can subscribe to. Would you have any info on how I could go about doing that?

> >> >Has anybody compiled code
> >> >using HiSoft C?
>
> No, but I did have a quick look at a cover disk version of Hisoft C a
> long while ago. I have a vague recollection it contains non standard
> functions?

Yes, HiSoft C has a library of functions that makes it easier to interact with GEM. For example, you can create dialog boxes within the program without having to use a resource editor and having to know a lot about object trees and the TEDINFO structures.

> Is Laser K&R or ANSI? [see below]

It's K&R.
>
> Is Hisoft K&R or ANSI? [I'm almost certain it's ANSI]

It recognizes the ANSI standard, however all of the library files you have to compile for the non-standard functions are written with the K&R style.

Laser C compiles all of the source files correctly except one. With the LIBWIND.C file I get three errors: "Different type in redeclaration of clear_window"

The other two errors are the same except that the function is different: pos_window and event.

I'm new to C so I'm not sure what this means. I don't notice any of the functions being declared more than once. If I remove the type the function is suppose to return the error goes away. For example, clear_window is defined as:

```
LONG clear_window(window)
LONG window;
```

If I change this to:

clear_window(window)
LONG window;
The error goes away.

However, the programs I compile crash after doing this.

Sorry for being long winded about this and for posting it here instead of at csap. Any help is appreciated

It's probably NOT a virus. The "bombs" are the system's way of telling
you there's something not operating properly. The number of bombs
translates into an appropriate error message for the service technician.
Count the number of bombs on the screen and let me know -- I'll tell you
what they mean.

Not to worry. I'll let you off ;-)
I just find it such a shame that it's got the potential to be the best FTP client available, but suffers from such a poor lack of support. Every couple of weeks I surf by to their web site, and nothing changes. Like I say, I've given up emailing them.

>>But what I was most surprised was that there was barely a mention of aFTP's
>>drag'n'drop interface which to my mind is the best feature of all.
>
> hmm, I wasn't aware of that feature.

I have to admit the reverse. I've never uploaded files any other way with aFTP. Dragging them to the aFTP window is brilliant! Never bothered with the other way (I guess one exists).

> BTW, how am I doing on my articles for AC? Do you like them, or
>should I make some improvements?

They seem fine to me. Apart from that misleading stuff that started this thread ;-)

Of course, I'd like to see an article on POPwatch and NEWSwatch, and Okami of course :-)

Regards,
Gary

Besides the brand of Desktopper and Freekeys, is there another way to make the Atari 1040STe into another case with the keyboard being separate? I want to in fact put it into a tower case like the PC world has. I don't care if I have to redo the backing of the case or not, I just want to save desktop space by having just the keyboard and the monititors on the top.

We go to great lengths to make sure that our remote access servers
are the best we can buy. Now I understand that it is frustrating to have
software work in one instance and not another, but to blame our equipment
seems a little strange. We service thousands of customers daily and if the
remote access equipment we had was unreliable or shoddy we would not be in
business for 4+ years.
I would like to help you out but I don't even have a debug trace to
work with. I talked to some of my techs regarding this and they indicate
that your computer is sending a LCP disconnect request. I do not know why
this is the case, but I would like to get it resolved and provide the level
of service that you expect and deserve.
What would you suggest we do in this case? 943-1198 is going away.
I can look at your problem personally, but since you have deemed that we are
not qualified to look at your system, I don't know what you want me to do?
I am one of the owners and it is completely within my best interest to see
that you are happy. So what do you want me to do?

Mark

Well this is it, if I can't get STinG to work with their new
boxs by Nov. 20, I'll be dead in the water and offline. The above

well. there's a fair question. I DO know that there were other solutions available, like the Lighthouse Tower, which were ready-made to install an ST or Falcon motherboard in. Even had a slot on top for the cartridge port.

At a Toronto ComputerFest a few years ago they concurrently ran an AmigaFest - and one developer brought a really nice-looking tower case for installing an A500 or A-1200 in, with the back nicely cut out for the ports. With a few mods, that would've made a nice ST case.

One of TAF's boffins - Jeff Thomas - is planning on re-casing his STe in the near future, so this will be something to watch. I know you'd need at least a full tower case to accomodate the motherboard for starters, and you'd have to re-route the cartridge port if you make constant use of it (the Best catalogue has an extender available for that purpose). I'd also point out that the new gizmo Mario Becroft is putting out - the one that allows for hooking up a PC keyboard and mouse - would be perfect for that purpose.

I for one would like to have my Falcon in a case - if only so I could have more air circulating inside it.

That's must not a virus.

Rename all auto start programs from .prg, .acc to prx., .acx
and restart the machine. If you got bombs imeditaly after
switch on you have a hardware problem. How many bombs you got?

Remove all cables.
Try again only with mouse, monitor and floppy drive. (If you have
an external drive)

2798. TAF Flea Market - Update

Newsgroup: comp.sys.atari.st
Date: 1998-11-14 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <364d1b43.0@nemo.idirect.com>
Source record: 90023
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy,alt.atari,comp.sys.atari.8bit

a little update to the TAF MonSTEr Flea Market on the 18th of this month....

Those on this forum in Canada who have been wondering about Mario Becroft's new PC Mouse Adaptor will have a chance to see this little gizmo in action at the Flea Market, as Ken Macdonald has brought in five of the little beasties which will be demonstrated. Three have already been earmarked as sold, and TAF is currently looking at putting in an order for more.

BTW, I got a chance to play with one of them at our exec meeting Wednsday and was very impressed - especially since it was attached to a Logitech 3-button mouse. The centre button was configured as a double-click, and was very quickly gotten used to. The Logitech is also very ergonomic and fit the contour of my hand real good. One other thing - Mario has designed the adaptor so that it plugs into the mouse port, then the cable runs under the machine so that the plug for the PC mouse can attach behind the computer - great idea!

anyway, details for the Flea Market follows.....

WEDNSDAY, NOVEMBER 18, 1998 is the date for the Toronto Atari Federation FLEA MARKET! The doors open to the public at 7:00 PM and will remain open until 10:30 PM.

This is your chance to come to a bazaar of Atari related pre-owned hardware and software where you may find that peripheral, application or utility for your ST/Mega/TT/Falcon 16/32-bit computer system or your XL/XE 8-bit classic computer system.

If you have original software or hardware that you no longer have any use for, get yourself a half-table and try to sell it! Or find that treasure that you have always wanted. Great deals should be in abundance.

Half-Table's will be $5.00 or the Full-Table for $10.00 each. Half-Table's are FREE to TAF MEMBERS. Admission is $2.00 per non-member family but if you are selling and have taken a half-table or more, admission is inc- luded. Admission for TAF members is, of course, Free.

The Flea Market will run from 7:00 PM to 10:30PM, with setup commencing for sellors after 6:30 PM, and teardown after 10:30 PM. This should allow enough time for as many people inside and outside Toronto to attend the event.

As usual, piracy cannot and will not be condoned. You must be selling original pre-owned software only. If anyone is caught selling pirated software or stolen hardware, they will be dealt with severely!!

The TORONTO ATARI FEDERATION Flea Market will be held in the "Rose Room" of the North York Memorial Community Hall on the Lower or Concourse Level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkhome Ave. Parkhome is 5 stoplights North of Hwy 401 running East off of Yonge

As I wrote, I mostly believe in that, what I checked :-) .
Please read carefully last paragraph of last Uwe's message here, and tell me, did I ever wrote about 'unique' features of my driver ?
I tested HDDRIVER Ver. 7.51, but only IDE hard disk part very intensive from two reason:
I wanted see, how this program works, and what can do.
I wanted help to Uwe to make it better - e.g. I explained him exactly what is problem by Western Digital drives, but Uwe accepted my kindly critic in wrong way.
I newer said, that Uwe's driver can't read IDE PC disks, actually I asked him about it, and I thanked for his answer - because it was not clear explained on his site.
Enough, or not enough informed, I can still say that HDDRIVER is complicated to
use. And it is no good if user must look in manual for every simple operation. Maybe it can recognize more than one DOS partition etc. However, I will not test it more, it takes too much time (and nerve), and lastly it will be considered as illegal use.
And what about asking me: 'Buy a legal copy of HDDRIVER so that you can read the manual and see...' .
I think, that nobody want buy cat in sack. And I want program, which I can use without manual. Author or distributor of program should care about informing people of program's features, and making demo which shows all them.

Gruss, Pera

>
>Where is the memory ?

In the 1040s the RAM is soldered onto the motherboard in 2 banks of 512Kb.

Either (or both) banks can be substituted by a bank of 2Mb giving you the possible configurations of 2.5 Mb and 4Mb.

The best way to do the substitution is to get a Marpet RAM extension card which takes standard SIMM modules. You will not be able to re-use the built-in RAM :-(

Just a thought, I don't like the green desktop, especially its tendency with some programs to go very bright, and for yearsI've used Magic.ACC - nothing to do with MagiC. This gives 3 options in low/med res - Blue (which I normally use), Green on Black or Amber on Black. In hi res its just inverse video. I find the amber setting easy on the eye after a long day!

The Sparrow is a Falcon prototype, and I believe only a very few (less
than 100) machines were made. They definitely exist, Michael Grove
owns one :-)

I put my Falcon in a PC bigtower, and it was pretty easy. Just attach
the bottom of the ST's shielding to the plate where the PC
motherboard usually sits and mount the ST's motherboard as usual.
You'll probably have to remove on or two of the 5.25" slots, a bit of
experimenting is required to find the best position for the ST.

You don't have to redo the back of the case, there are usually lots of
holes for D-contacts there so just make some simple extenders for the
ports you want access to.

Then steal +5v, +12v and ground from the tower's PSU, mount floppies
and harddrives in the tower's drive-bays and you're off.

Alright, now if someone could explain that to me in lamens terms, I'll be all set. I said I don't know anything about hardware, so you send me to the quickfaq, which says you have to move jumpers around and set jumpers, and set some kind of Media Change thing, which none of makes sence to me.

IIRC they were originally 40 (ie before the supermon? version was made)

I've had one gathering dust since I replaced my STE with a MegaSTE as it
didn't work on that or the Falcon.

Commercial distributed by Toad Computers. A nice program, but no longer
supported nor distributed. Once, very strongly supported by the author
who, at some point, felt burned by pirating and just quit. :(

I still use and will until *something* breaks it.

Trever, the few occasions I operated in ST-Low or med on my ST, I had the
control panel set for a dark blue desktop. The green one made me sick too!

It's real strange that later resolutions always provided the bloody green
background again... Glad I set the stuff to light/dark grey in Thing, my
menu's are grey (Menu3D.prg), the backgrounds in Thing's dirs are grey,
and every program supporting color change of the background is grey too.
It's by far the most neutral background to stare at for hours... and
that's what I do many times.
BTW, I'm using a slightly modified palette for the first 16 system colors,
especially the range 8-15 has some modifications. Even in Truecolor these
changes work.

Look for a US company named IOtech. They are devoted to IEE488 and have,
among many other IEE488 products, the Serial/IEE488, Parallel/IEE488
and SCSI/IEE488 interfaces (external devices, in neat black boxes).

National Instruments also sells similar products, I think that some of
them are physically the same as IOtech ones (who REALLY makes them,
I wonder).

Be warned, however, that IEE488 interfaces can be quite expensive.

The web sites of the above-mentioned companies are on
www.iotech.com and www.natinst.com (if I remember correctly).

Best regards...

Be careful of the size of the Newdesk.inf file as it approaches 3k to
4k funny things start happening with file names (at least with TOS
4.01.

For TOAS 4.01 I don't think there is a limit on the RSC file size.
For 2.05/2.06, I believe it is limited to 64k

What machine (ie ST/F030/TT030). What Version of the CAB.OVL are you using? Have you tried to un-write protect the file. Does the error message "cannot find file" or something like that pop up. Certain versions of the CAB.OVL have problems like this with certain TOS's and certain versions of Cab. Also check out the size of your newdesk.inf file. Keep it under 2-3k.

Hello All:

I have a question...What is NVDI? Is it something like Speedos?
Is it BETTER then Speedos? is there any web addys to look up on this?
I guess that is four questions! Any info would be great!

Thanx

>
Hi Tim,

it is said that musicians live in another world... I guess that must be true :-)

Good Lawd, an Atarian NOT knowing about NVDI... these are really scarse!

OK, once upon a time there was this ST coming out with a wonderful OS with a graphical interface for a price about one-third of the Macintosh. After some time some people found that parts of this OS weren't that good, so they decided to improve it. In fact all parts of the OS were not that good, but that's not the question here.

The VDI-part, of which we're talking now, was clumsy, slow and something more. So very soon new VDI routines were written, called NVDI.

Another clumsy part of the original OS was the added GDOS (Graphic device output system), which wasn't ready when the other OS parts were, so it was issued as an additional piece of software. Also this GDOS was clumsy, so the NVDI authors rewrote those parts too and integrated it into NVDI.

In time several additional features were built into NVDI, like support for True Type fonts and now also Postscript support.

So what is NVDI nowadays? First of, it speeds up your machine, especially the screen drawing.
Secondly, it adds the use of all different fonts on your system. Including TTF types.

It is too much to mention all the features, but let me tell you 1 thing: once you used it for 1 day, you don't wanna go without the remaining days.

It is commercial, I think ASH sells it in Germany and any, just any Atari dealer sells it too.
Haven't got a URL for ASH, but the Behnes in Germany (authors) have a site at http://home.t-online.de/home/ToBeHome/homepage.html and from there you go to "Produkte". It's all german, but it lists the features of the latest

version 5.

No, actually, the Sparrow was designed before the Falcon and they went
with the Falcon instead. It was to replace the STe line I believe.
There's only a few prototype models out there from what I understand.

2840. Atari / Nokia Communicator 9000 & 9110 connectivity

Newsgroup: comp.sys.atari.st
Date: 1998-11-15 00:00:00 UTC
From: Werner Domroese / Q5 <q5@spam.not>
Message-ID: <72nfai$pgi@news3.euro.net>
Source record: 89916

Hi there,

Does anyone have a clue as to any special interest prog written specifically for connectivity between Atari TOS compatibles and Nokia Communicators has ever been written?

If so, and if available as shareware and/or freeware, would you please care to share the URL with me?

I'm very interested in apps for use with my Ataris AND my Communicator. Even for PC's, software for the Communicator, although Geos-based, is scarce AFAIK.

I don't mean general comms apps with X-modem transfer and such, but really custom software (but not necessarily from Nokia. Third party is more interesting...)

Thanks for any replies...
PS - Any info on comms software other than Portfolio or Communicator is also very welcome :-)

I may do a newsletter type thingy next year (or even next month) - but I need your stuff.

Any letters, articles, etc. could you please send to me, preferably in an image (it's gonna be based on DEGAS pictures) any format - I don't care. But you can send them by ASCII, which *is* a lot better.

PS. To receive it if/when it comes out, email me

PPS. It'll be a lot better if I could get my hands on a program called Atari-Text - I think it's shareware, not sure. If anyone could tell me where I can get it from, I'll be greatly appreciated.

Can somebody help me with similar information for my 540MB IBM DSAS-3540
SCSI drive. When the computer/drive is turned on, the drive will not boot.
I have to wait until the computer checks if the floppy is inserted, then
I have to reset the machine and then it boots OK. After that, I can
turn the computer on/off (the drive has a separate power supply) and it
boots OK without a need for reset.

I checked with various disk drivers- it is the same. Also, other drives boot
OK with my hw/software combination.

Beside the ID jumpers, the drive has several jumpers that I do not have
any information of. Btw- it seems not to have the connection for external
LED. Can someone comment on this?

My guess is that it has to do something with "Unit attention" on power-on
and I found a document (unfortunately in German, which I understand very
little) that says (if I understood correctly) that some drives have to be
interrogated twice after power-on, and that later TOSSes (2.06+) have this
feature. But, until I upgrade the ROMS, I would like to boot without
complications. Any comments? Thanks in advance.

The relevant configuration is: Mega ST 4MB, GE-Soft SCSI adapter,
IBM DSAS-3540 drive, ICD driver software.

Btw. I picked this drive because I often work with a computer late at night
and the drive is unbelievably quiet- the Mega's fan is much louder!

Regards...

Saving the desktop updates the DESKTOP.INF file (or NEWDESK.INF
for newer versions of GEM) that automatically reinstalls the new drive
icons when you reboot. If you don't, each time you boot your computer
you have to use the "Add Devices" command from the menu bar.

Once you're done with the ICD utilities, quit back to the maindesktop
and use the menu bar to INSTALL DEVICES, then SAVE DESKTOP.

Hopefully, that will solve one problem.

2849. MINT HELP

Newsgroup: comp.sys.atari.st
Date: 1998-11-15 00:00:00 UTC
From: Tom & Glynis McCartney <tmccartn@calcna.ab.ca>
Message-ID: <72o9ia$cus@ds2.acs.ucalgary.ca>
Source record: 89925

I am trying to set up mint on my falcon. I have gotten the the KEMD files and installed that, and everything went very well. Now I want to upgrade to the latest version of MINT. I can't seem to get the TAR.ttp program to work. If I run it form the shell it simply ignores me. (machine pauses for a second and then returns to the prompt.) if I run it form the desk top it does pretty well the same thing.

If I run it form magic I get an error, path not found, cannot creat path.

What am I doing wrong?

Tom McCartney
Falcon 030, Magic 5, NVDI 3, FX 14MB AND MAYBE MINT. Maybe not

2851. About HDDRIVER V 7.60

Newsgroup: comp.sys.atari.st
Date: 1998-11-15 00:00:00 UTC
From: Pera Putnik <ppera@soyaprotein.com>
Message-ID: <72l759iqg1@SOLAIR2.EUnet.yu>
Source record: 89975

This message will be a bit long. Since I been accused for diverse things, like 'always be wrong', talking about unique features of my software which are for years in other programs (*), criticizing other's software without enough info about it etc., I must clarify some stuffs. There were many misunderstandings, talk about diverse versions of HDDRIVER etc.
All my critic was about version 7.51, and I don't see that I overstated. Actually, I wrote to Uwe Seimet much more critic, than in comp.sys.atari.st.

Today I tested demo of V 7.60 with PC drives, and I must tell, that it is big improvement, and many things, what I criticized work better.
Little history of testing V 7.51's IDE PC disk read capability: It was about one month ago. I read something about it in readme file, and I wanted check it right now.
I connected PC drive, with one partition of 100 MB. After necessary param. modify and restart, HDDRIVER wrote that found partition C, but I couldn't open it. Then I checked partitioning drive in DOS format, and read it on PC - from some reason it worked not.
I suspected that program works only with SCSI PC drives, and problem by IDE drives is perhaps in required byte swap. Other problem was, that nobody informed me about such capabilities of HDDRIVER, when I had put message 'Bigdos and Rwabs' to comp.sys.atari.st . And some Falcon owners didn't knew about it too.
Today I know, why I couldn't work with 'Big' PC partition - I should first run program BIGDOS ! But why HDDRIVER simple not warned about it ?
After all it, I didn't tried work with PC disks with V 7.60 demo. I wanted testing his partitioning and drive parameter modifying, but it is all disabled in demo.

Well, today I tested V 7.60 demo with four IDE disks, with diverse DOS partition combinations. (These drives I used for testing my driver).
1: 100 MB Seagate drive with one primary DOS partition of 100 MB - driver recognized and worked with it, without any need to modify it. Excellent ! (Of course BIGDOS must be loaded first) .
2: 240 MB Conner with 4 logical drives in one extended partition - HDDRIVER recognized, and worked with all. Prima.
3: 210 MB Seagate, but with unusual partitions: 1 primary, 1 primary hidden, Boot manager and again one primary hidden. Making such combination is not possible with Fdisk, but may with e.g. Partition Magic or IBM boot manager and OS/2's Fdisk. HDDRIVER recognized only first partition. This is not big drawback, since such combination is very rare used.
I included recognition of hidden partitions too. Purpose of this hiding is not some data security, but fact that DOS and WIN95 can't reliably work with multiple primary partitions (I was curious and once checked it, and didn't observed problems :-).
4: 1.6 GB Western Digital 31600 - drive was recognized. Although boot was

from floppy (due TOS's lack no autoboot from this HD possible), HDDRIVER couldn't find any DOS partition from 3 present. I wrote about it couple times, so I will not repeat reason.

My conclusion: all this mess could be avoided:
1: If I would accented oftener that I tested V 7.51.
2: If Uwe Seimet instead mentioning manual and years old features, simple informed me that he talks about version 7.60.
3: If list of improvements in readme file of V 7.60 demo would be more detailed.
4: If I spent 5 times more time for testing HDDRIVER... :-) .

Can you go back to STIK. This happend to me. My provider (mersinet)
changed to a "faster upstream provider", and since then I've been
unable to connect via StinG. Reverting to Stik got me on-line again.
The "faster upst.." is faster, 5k a second in CAB. Examining log in
reveals a new line.. "your annex address is" what is an annex address?
Someone else in this NG posted a similar problem a few weeks ago.

Hi!

I have found that even 720K floppies formatted on the ST
end, are good enough for file transfers-especially with
the Atari CD ROM's on my PC. Even, an 880K format will
work fine for file transfer.

I am getting a 12x SCSI CD ROM for my soon Falcon, then I
can avoid the PC transfer. But, like I have said, I
have had no problems with ST formatted 720K's on my PC.

Regards,

Jim

FreeMiNT 1.15 is probably a better solution than BigDOS... In addition
to normal FAT16 it will also support FAT32, both with or without VFAT.

2873. Complete out-of the-box gcc setup?

Newsgroup: comp.sys.atari.st
Date: 1998-11-16 00:00:00 UTC
From: giovanni.ciampa@henderson.com
Message-ID: <72pb8udes1@nnrp1.dejanews.com>
Source record: 89848

Quite simply - I'm looking for a complete 'out-of-the-box' gcc setup.

I've downloaded various versions (2.5.8, 2.6.2 and 2.7.2) along with suitable include and library files, but linking always seems to fail as it cannot find certain .olb files - for example: running g__.ttp (renamed to gxx.ttp) from the 2.7.2 archive fails looking for 'stdc++.olb'

Any pointers would be gratefully appreciated.

Gio

2874. Super Sequencer

Newsgroup: comp.sys.atari.st
Date: 1998-11-16 00:00:00 UTC
From: JackHammer <jhammer@indy.net>
Message-ID: <72p06k$jm0$1@news.indy.net>
Source record: 89849

Whatz Up Group?
I have been using Super Sequencer for several years to run midi equipment. For the past 2 years I have been using Cakewalk because my 1040st e locks-up on me all the time. However, I would like to know if there is a program I can use on my IBM PC that will allow me to run Super Sequencer(SST) program and use all of the songs that I saved on the Atari? Or is there a new generation sequencing software available for the Atari that is similar to Super Sequencer? Something with a more accurate clock.
Thanx
D.J. JackHammer http://members.xoom.com/Fiendz1

>
Hmm, only logical explanation for all is then, that I get corrupted copy
of your driver.
Conclusion: people, newer use illegal copyes of software.

>>And some Falcon owners didn't knew about it too.
>
>They should read the manual, then.

And of course, buying your software...
I wrote about it, why is people not enough informed. And look to Atari
FAQ(s), there missing a lot of information.

Well, I'm wrong, that I started testing software from bad source. And of
course, I didn't knew about demo, then .But situation here, in Yugoslavia,
is that purchasing legal software is almost impossible. I can send money out
only in envelope, and I don't like it. And if software comes, I must pay not
low custom. Traveling to Western countries is also problematic - getting
visa, etc. Only positive thing what happen in last years is Internet.
Everybody, who makes software should look how similar programs work, and it
is usual.
Of course, Uwe said - then you should not use it. But it was clear from my
messages, that I tested it, and I sent my critic in best intent. If I wrong
in something, Uwe could better react on that. And I was not alone with
similar objections.

Everybody knows, that piracy is one of the reasons for Atari's 'death'. But
we have today even more piracy, than in Atari's best days - Internet is full
with ftp-s and sites with registrations, 'cracked' etc. software.
My opinion is that best weapon against piracy is making best possible
software, for lowest possible price.
Sadly, by Atari it is almost impossible - count of users is too low.

Pera

2877. Re: driver for IDE PC hard disks

Newsgroup: comp.sys.atari.st
Date: 1998-11-16 00:00:00 UTC
From: Pera Putnik <ppera@soyaprotein.com>
Message-ID: <72pdku$f6l$1@SOLAIR2.EUnet.yu>

>have a manual.

Well, this is may last message in this discussion. This newsgroup is not
found for such discussions.

I simple can't understand how so experienced and well-known programmer
like
you can't accept so simple thing. I talk about HDDRIVER, not UTIL. If every
newer PC BIOS can perform that initialization after reboot, why
one Atari HD driver can't . It has no any relation with manual, it is
matter of simple usage. And I don't see why is not enough just run driver
from floppy and
work. I'm, amateur programmer solved it very easy.
With my critic I just wanted achieve that your program become more user
friendly. ...Uh, I should not say it, this may be understood as another
critic.
>
>> It's not my fault, that people (and myself) is not enough informed about
>> features of HuSHI (I even doesn't saw WEB site about it) and HDDRIVER.
>
Another misunderstanding. I wrote it mostly because I'm not blame Mario
Becroft for it, what he wrote here.
If somebody must buy program, and read manual to know about features of it
(we talking now about features, not usage) - is it good way of informing
people ?
I tested HDDRIVER very intensive, and I'm mostly criticized too
complicated usage, not lack of features.
I can say that HDDRIVER is best disk driver program for Atari, what I saw.
But
everything could be better. One thing, what is required for it is listening
to people who makes critic, even if they are not always 100% in right.

>If you don't know enough about these drivers, don't write that they
>don't have features they actually have.
>
Attack is best defense. Instead it, you should answer about something, what
I pleased you.

The End.

So people, who had nerves to read it all - sorry if I was boring.

Pera

2878. Strange (?) visits to my Homepage

Newsgroup: comp.sys.atari.st
Date: 1998-11-16 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <365038623235b40@holleman.demon.nl>
Source record: 89853

Hi,

just checked the excess users on my homepage again. Well, not the excess users, but the days that those pages had a large number of visitors.

Top 3 for 1998 is now: 12/10 with 255 visitors,
24/4 with 148 visitors,
14/11 with 119 visitors.

And now for the strange part: while I can explain about 24/4 (just put SoftPC up there and announced it) and 14/11 (must have something to do with this Matrix stuff), I can't figure one reason why I had 255 visits to my page on Oct. 12.... Nothing special put up there, also no announcements so that one really puzzles me... :-) Also the D/L part shows nothing exceptional on D/L binaries, so most of them have been just looking around. And I can't recall having had Fish&Chips available for free then... :-)

>Hi there!
>Is it possible to access an external SCSI-Harddisk with a PC and Falcon?

Yes.
PC must have internal scsi controller. Connect devices in line between
both machinces, falcon id7. Do not terminate a device in the middle.
Both computers are terminated. That's enough!

Watch out! Falcon must allways switch ON if you use scsi only from
pc side! Falcon doasn't terminate the scsi bus if he's OFF!
(Design problem from atari, a simple fuse, diode are missed) :/

Works fine for me, but with a PowerMac.

Do not wrot data from both machines in the same time to the
same partition on your SCSI devices in the middle.

Chaos follows imeditaly :->

Nice CD-ROM, CD-Burner sharing..

Regards, Robert

Umm, maybe I shouldn't upgrade to N_AES 1.2 :). V1.1.6 is working fine with the latest version of NVDI and WDIALOG. I'm old fashion and still use XCONTROL :). I also may have not hit the proper combination yet to cause problems either.... I run WDIALOG from the autofolder, after MiNT, i'm pretty sure. With out it, I noticed the Printer CPX doesn't work and I get an occasional error from CAB.

>

Well, ok, let's give it a try.

A jumper is a small (approx. 3mm) plastic and metal clip that makes a connection between two pins. It is usually used as a way to configure hardware. You would usually have a bunch of pins like this :::: somewhere on the drive, usually on the back, next to the connector, with 2 or more pins connected together with a jumper.

The problem here, is that all floppy drives are different, and most of the latest ones don't have any jumpers because they are made to go into PCs, where no extra configuration is required. This is one of the reasons it is recommended to use an older Sony or Teac drive with the appropriate jumpers.

The jumpers you have to set, are the drive ID set from 0 (PC) to 1 (Atari). Depending on the drive, this can mean switching a jumper from one pair of pins to another, or removing a jumper when there was one, or putting one in where there isn't. This is really a matter of guessing what the marking near the jumper pads mean as they could be "ID#" or "DS0/1" or just about anything like that.

The other jumper to be changed is "media change" or "disk detect", which could also be labelled "MC" or "DD" or "DK" or just about anything. If you can't find this jumper, then just stick the fmc.prg file in your auto folder, and forget about it.

Chances are, however, that the drive you have doesn't have any jumpers. In this case, the only valid option is to open it up and have a look at the printed circuit board. Most of the time, the jumpers will have been replaced by solderpads (little metal pad like this --O O--) where you are supposed to solder a bridge between them. Again, the trick is to identify the appropriate solderpads and try not to screw up the drive.

I realize this is not the type of answer you were asking for. I have personally performed this on a Mitsumi floppy and it works. Other people have experience of Teac or Sony drives, but there is no one foolproof method. Maybe if you told us the make and model of the drive, we could

be more specific.

Hey all,

Looking for a good alternate desktop for use on my TT030 (ET4000 VME card,
running NVDI 4.x for ET4000).

Are there any good freeware desktop replacements? I found some cool
desktops but they were in German, and mine Deutsch ist nicht sehr gut. :)

Any recommendations welcome.

2887. Trust W95 PC kbd to Falcon

Newsgroup: comp.sys.atari.st
Date: 1998-11-16 00:00:00 UTC
From: Jan.De.Smedt@village.uunet.be
Message-ID: <72pq4d$j4b$1@xenon.inbe.net>
Source record: 89862

Hello everyone,

I connected a Trust W95 kbd to my Desktopper Falcon.

The connection is made with a print called Adaptakey,
http://wwwusers.imaginet.fr/~oxo/systems

I use the Adaptakey driver in the AUTO folder like they say, but
for the kbd to work I also have to use Pascal Fellerichos CKBD Deluxe
with the French kbd table. That way it works in TOS, Magic and N_AES.

My problem:
The Adaptakey driver dates from 1994 and so does CKBD.
It is a AZERTY kbd so I use F.KBD.
The top row keys (with the numbers) have two symbols in the lowercase
position and the keys next to "P" and "M" do not print the right keys.

- How do I get ASCII 045 "-" and ASCII 095 "_" to work properly?
They are next to the BACKSPACE but all I get is "=+" in TOS.

- What about the following characters?
[] are lowercase right next to the "P"
{} under the "9" and "0"
and \ are unreachable (lowercase right "3" and ">")

Does anyone have a correct CKBD *.KBD file so I can get to the keys?
Especially BACKSLASH is important for pathnames etc.

Greetings,
Jan

2890. STinG/CAB and Falcon

Newsgroup: comp.sys.atari.st
Date: 1998-11-16 00:00:00 UTC
From: dwmoar <dwmoar@spiritone.com>
Message-ID: <36506EEA.D57035DC@spiritone.com>
Source record: 89865

Hey need some help and or ideas. Got a Falcon and have been running STinG and CAB 2.5 The other day I went to get onto the internet and it dialed and connected just fine, but when I loaded CAB it just set there and never tried to connect. I have reloaded everything the CPX's the dialer/sting/CAB Now when I goto the Serial CPX and try to save the setup I get

Can't set protocall due to
Illegal combination of
Bits/Parity/Stop Bits/Flow control for "Modem 1"

I currently have it set for Modem 1/8 bits/0 parity/1 stop bit/rts/cts for flow control

this is the same setup that I use on my MegaSTe which works just fine.
Also when in the dialer using the configs(miscellaneous) the serial port show "MODEM 2" which cannot be changed. I therefore checked the Dial Script which is indeed set to serialport = modem 1. I just don't know where to look from this point. I am wondering if this is a Hardware or a Software Problem. Any ideas or help would be really nice. I do have snapshots of my control pannel settings the only one I do not have a snapshot of is the dilar config misc. as it bombs out when tryint to exit the program if this helps.

Thanks David

*Looking for a good alternate desktop for use on my TT030 (ET4000 VME card,
*running NVDI 4.x for ET4000).

*Are there any good freeware desktop replacements? I found some cool
*desktops but they were in German, and mine Deutsch ist nicht sehr gut. :)

How about THING ? There is an english version. It works with possibly
every system You can run on Atari (TOS/Magic/Geneva/MiNT). Thing is full
of features and can be downloaded from any GOOD atari FTP site.
The program itself is shareware so you can test it before buying.

Calamus has a steep learning curve.
Be prepared to spend a good couple of days working on it to get to know
the fundamentals. About DA's Layout I cannot speak.

Hmmm when I think WAAAAAY back, there also was an article on IEEE488 and a DIY project in a German computer mag called "Computer'Technik" (or perhaps I read it someplace else). Don't remember where or the ins and outs though. They featured a IEEE488/IEC625 for the megabus.

Ooo, you've set me off now! :-))

Mark Williams C. It's K&R "+1". It copies structures like ANSI and has
'void' but only for function results, you can't use 'void' as a
datatype. It also has one or two other ansi keywords (like 'const')
which it accepts syntactically but doesn't actually implement. It
won't handle ansi style function definitions or declarations. Nor does
it have any optimisation to speak of. A bit of peephole stuff but no
register intelligence.

That's most likely made it sound awful. In actual fact it is a very
good compiler - if wasn't I'd have switched to something else years
ago! In all the years I've had it I've only ever found one bug in the
compiler and mwc replaced the whole package without me even asking (or
expecting it). Naturally there's been one or two bugs in the library
code but they're easily fixed 'cos I've the complete source code for
the lot. Since then there's never been a single bug. That's something
which can't be said of Lattice or PureC - which is why I won't change!

It's complete lack of register optimisation is an advantage. When I do
use register variables I know exactly which variables will go in which
registers and that they'll stay there. Lack of function prototypes is
no problem - I can still use them wrapped up in a macro. That way ANSI
compilers get the info but the K&R has it mapped out - ie ...

blah function __ARGS((void bob, int fred));

the K&R sees

```
blah function ();

and ANSI sees

blah function (void bob, int fred);

Best of both worlds! ;-)

And, who needs va_args when you can do this:

foo(r)
char **r;
{
printf("%r",&r);
}

main()
{int i =whatever;

foo("oo-er [%s]\n","Hello World");
foo("%d\n",i);
}

Or this ...

extern long _stksize;

foo()
{int fred;
struct doofrey thingymabob;
eek v;

if (&v <= (_stksize + 128)) {
printf("Stack near overflow\n");
return;
}
/* function body */
}

Who needs the overhead of a compiler option which stack checks every
call? Just do it at runtime in the deepest calls yourself, and you can
recover - even increase the stack size!

Tbh, mwc does have a source line debugger but I didn't have it
originally (it were a later addition it were). Learning C via an asm
debugger _is_ hard but it pays dividends in the long run. Having said
that, I must admit that although the object debugger is at the asm
level, the compiler can be told to produce asm source with comments.
The comments are verbose enough to tell you source line numbers for
asm sections and where variables exist, both static and local.

No, but if I get time I'll have a look over the weekend though.
Fortunately this newsgroup is pretty flexible so it isn't a problem.
It's just that I tend to let things here build up for days whereas I
check csap every time I log on.

Good. That's a major problem out of the way.

>Laser C compiles all of the source files correctly except one. With the
>LIBWIND.C file I get three errors: "Different type in redeclaration of

>clear_window"

Those other functions in LIBWIND.C, can you find their declarations?
They'll either be in the source code (usually near the beginning) or
preferably in a header file, hopefully LIBWIND.H but tbh they could be
in any of the headers. Don't bother trying to find any for functions
which have 'static' in front of their return type.

>The other two errors are the same except that the function is different:
>pos_window and event.

I suspect you won't be able to find clear_window(), pos_window() or
event() anywhere?

>I'm new to C so I'm not sure what this means.

It means that having been told the details about a function, the
compiler then encounters conflicting details. This example'll produce
a similar error ...

```
short foo();

main()
{
foo();
return 0;
}

char*
foo()
{
return ((char*)0);
}
```

Btw, don't worry about ((char*0)). It is just there to keep the
compiler quiet by returning a value. Some compilers will moan
otherwise and we don't need that getting in the way here.

>I don't notice any of the
>functions being declared more than once.

There's such a thing as implicit declaration. The effect of this is
without you writing anything the compiler ends in the same situation
as the above example.

An implicit declaration occurs when the compiler encounters a function
being used and has neither encountered an explicit declaration, nor
the function definition. An implicit declaration will have a return
type of 'int'. Example:

```
====1====
char* foo(); /* explicit declaration */

main()
{
```

```
foo();
}

/* function definition */
char*
foo
{
return ((char*)0);
}

====2====
/* function definition */
char*
foo()
{
return ((char*)0);
}

main()
{
foo();
}

====3====
main()
{
foo(); /* implicit declaration "int foo()" */
}

/* function definition */
char*
foo()
{
return ((char*)0)
}
```

In =1= there isn't a problem. This is the usual way code gets written: there is a declaration for each function before its definition is encountered.

In =2= there isn't a problem either. This is because the definition is encountered before anything attempts to use the function. It does not matter that there is no declaration. In this instance an implicit declaration is made but the compiler gets it exactly right because it uses the definition to figure it out.

In =3= it all goes pear-shaped. The function is used (referenced) before its definition and without a preceeding declaration. An implicit declaration must be generated. When the compiler eventually reaches the definition it realises it has guessed wrong and out pops an error.

>If I remove the type the function is
>suppose to return the error goes away. For example, clear_window is defined
>as:

This re-inforces what I'm thinking - that no declarations exist for
those three functions before they are being referenced.

>LONG clear_window(window)
>LONG window;
>
>If I change this to:
>
>clear_window(window)
>LONG window;
>The error goes away.

This'll work under Lattice (the intended target) because
sizeof(int)==sizeof(long) and LONG will be declared somewhere to be a
'long'. Therefore when Lattice sees the function reference its
implicit "int clear_window()" will match because it uses the same
storage space as 'long'.

I'll bet Laser has sizeof(int)==sizeof(short) which does not match
LONG, hence the redeclaration errors.

>However, the programs I compile crash after doing this.

This may sound odd, but don't worry about it. By taking away LONG
you've made Laser's implicit 'int' match the definition. Trouble is
Laser has sizeof(int)=2 whereas Lattice has (by default)
sizeof(int)=4.

In english, what this means is Laser returns 16 bit values for its
integers whilst Lattice returns 32 bit values. If those lost 16 bits
in Laser are important then it could easily crash.

>Sorry for being long winded about this and for posting it here instead of at
>csap. Any help is appreciated

The problem? Nearly forgot! Bug in the source code methinks. Put this
right at the top of LIBWIND.C just after the #include statements ...

LONG clear_window();

That error should be gone. Do the same for the other two functions (ie
declare them the same as their definition).

If that doesn't work I'll be surprised - in which case email me. I'll
have to look at the source code.

I was not able to use DESKICON.RSC with more than 128 icons on TOS 2.06-
I get bombs. There is also a maximum on how many icons can be in the
TOS2.06 desktop- this number can be increased somewhat by editing
the second of TOS resource files (there is that "tospatch" program...).

will include SC1224 Atari Monitor for extra $20.00
+shipping or will sell seperatly

Other things I am considering selling...

*iomega zip 100 with 3 100MB disks $100.00 (SCSI)
*Panasonic 8X CD-Rom Internal or External, you choose,
this is also SCSI
*160MB IBM SCSI hard drive (internal) $30.00
*2100MB Syquest SCSI hard drive (internal) $160.00
*Atlas Periferals External 33.6 Data/Fax modem $40.00
*14" Laser SVGA Monitor

Please email atari@wcoil.com

Thanks

JoNk

Same thing would happen if you were running STzip with a LZH file.
afaik the latest mint kernal are gziped only.
What extension does your archive look like?

filename.tar > use tar
filename.gz > use gzip
filename.tgz > use gzip, then tar
filename.tar.gz > use gzip, then tar, same as above.
tar.gz = tgz

Hi Kevin,

I have Logic 2.5 (the last version) and the Log3 dongle that goes with it. I haven't noticed the dongle causing problems running other programs... but then, I usually remove it when I'm finished with whatever project I'm working on because it's really in the way where it's at. I HAVE had it in when running many other programs without any problems. What won't work on your setup when the Log3 is plugged in?

The same thing preinst does can be done by HDDRUTIL, namely creating a
boot disk. Don't complain about things you don't know because you don't
have a manual.

> It's not my fault, that people (and myself) is not enough informed about
> features of HuSHI (I even doesn't saw WEB site about it) and HDDRIVER.

If you don't know enough about these drivers, don't write that they
don't have features they actually have.

See above. 7.51 or 7.6 doesn't matter.

> 3: If list of improvements in readme file of V 7.60 demo would be more
> detailed.

The list is detailed enough. As there was no change between 7.51 and 7.6
concerning IDE compatibility I don't list this as a change, of course.

I received a large Notator file from a composer and should import it as a Midi file. Unfortunately the guys atari doesn't work any more and I don't know anybody around here who has one. Is there a nice guy somewhere to whom I could mail the Notator file (xy.son) and he could convert it to a midi file and mail it back to me?

> lost.
>

It's not a virus. The bombs on the ST are a kind of error message
telling you the
machine has crashed, like the "blue screen" on a PC, the "guru
meditation" on an Amiga or
the bombs on a Mac.

Basically, it means that either the hardware is playing up, or there is
some software that is crashing the machine on startup. This could be a
desk accessory (.ACC files) or an AUTO folder program, or a corrupted
SHDRIVER.SYS file.

Are you using a hard disk ? If so, does it boot from a floppy (press
"Alt" while booting) ? Load a disk with the AHDI software (from the
Quick FAQ if you don't have a backup one), run AHDI.PRG and install the
"C" icon. Then go in the HD and deactivate any AUTO program files (by
renaming them from .PRG to .PRX) or desk accessories (from .ACC to .ACX)
until you find the culprit.

If the ST won't boot from a blank formatted 720K floppy, even with the
HD unplugged, then you have a hardware fault. Try taking it apart and
reseating all the chips.

Well, if it's that kind of laymen's terms, then I suggest you should get
it done by someone who can handle a screwdriver.

I certainly won't go into the detail of describing how to remove screws,
change a jumper, and plug in a cable.

Hi Tony,

good thing to know. OTOH, isn't that true for all those counters people
get from SiliconValley etc. by just adding a link?

I was glad with this service from Demon, the only thing is I want to keep
an eye on the other page as well and this looked like the only way to get
counter nr. 2 going. If I experience too much trouble with it, it's just a
matter of removing it again :-)

It's a program which "emulates" teletext. You write your own pages, and
you can then load them into the program, like text.

'ello,

i have both of these moniters for sale or trade
i will not ship them unless i get a large offer
i live a mile from the the DE / PA state line
i will drive anywhere within an hour and a half
from here for delivery...if you come here i will
almost give them away.

both work except for the 124 the cord to the
computer is cut (i have the cable...)
no scrathes or dings on screens.
for trades i am looking for vcs and 8bit stuff

sloopy.

It's possible to take that 2.5Mb and add the disabled 512Kb bank to it to make 3Mb, however I wasn't too happy with the mod I made on mine as there were "holes" in the screen display indicating some memory corruption.

There are a few utilities around that will write either an auto folder prog
or a special bootsector to a floppy disk - either will allow your Atari to
boot from the drive without the need to perform a reset.

Afraid that I can't think of any names ATM but NOROACH comes to mind.

You don't think so though you're from France? Maybe you don't know that
the reason why there won't be new French versions of HDDRIVER is that
Terre Du Milieu, the former distributor, sold copies without ever paying
for them, i. e. illegal copies. At least for the French version of
HDDRIVER this piracy was the death.

The modem port on a Falcon is actually Modem 2 (SCC chip). The Modem 1
(MFP chip) was not actually connected. Therefore, on a falcon, you
should be using the Modem 2 setting. Don't forget also to use the
SCC.PRG instead of MFP.PRG with the HSMODEM package.

Yes, I tried this, too, but the delay introduced by the extra
electronics caused failed 'reads'. Getting faster RAM would have cured
it but this was hardly the point, was it :-)

2950. CAB - Download problem

Newsgroup: comp.sys.atari.st
Date: 1998-11-17 00:00:00 UTC
From: paul.williamson@zetnet.co.uk
Message-ID: <72rkpe$h58$1@roch.zetnet.co.uk>
Source record: 89806

Hi all,

I recently downloaded Freedom 2.05 (frdm205d.zip) from the website, using CAB 2.05 under single TOS, and some odd things happened.

At the end of the download the file was opened into my text editor and I could not find it anywhere in my "Download" folder.

I eventually found it in the "U" folder of my "Cache" folder, as 00000E66.ZIP.

The same happened when I downloaded the English application and configuration module (F2english.zip), and this appeared in the "C" folder of my "Cache" folder as 00000E6E.ZIP

If the files had not been opened into the text editor I would never have found them. As it was I could read the path from the editor.

I have looked for options to set the Download path, but there do not appear to be any. I think in the past the file selector has been opened automatically after a file has been downloaded, so that I could chose the path to save it.

If anyone knows what is happening, or would like to try it for themselves, these are the site addresses:

http://www.cix.co.uk/~inactive/ (for the Interactive site).

and to save you some links...

http://www.freeyellow.com/members2/chrisker/ (for the Freedom download site).

Cheers

Paul

2951. ICD & Hard disk Problem, help needed

Source record: 89807

Hi there,

Well, my Atari 1040STE is connected to 2 SCSI disks via an ICD Link2 interface. Few weeks ago, I though the interface (with help of this newgroup), or the power were faulty, and done a lot of tests without success. Now, the first disk HAVE a problem , sometime (more and more often), I can't access this disk. As I have two disk, my idea is to make a full copy of the first disk onto the second (with quite the same partitions size, but different names), and after that, to unplugged the first disk and start with the second one.

I'm quite sure there some tips, tricks to achieve this operation (what's about the desktop, partitions, names, ...).

Thanks for your time and answer.

But the corresponding GEM.SYS for MiNT is pretty good. It's a lot
faster than the previous version (which was shipped with MultiTOS) and
most of the bugs are killed too. It can't compete with N.AES though,
but for practical use it's the second best AES for MiNT.

Hi Paul,

this must have happened everytime you D/L files with CAB!!! The files simply go to the path you specified for "Cache"... and this obviously is the Cache directory.
When I D/L files with CAB, the (Freedom) fsel pops up and indicates a path to my cache folder. Next I change that to C:\NEW\ and that's where the file goes then. It also goes into the Cache dir, because it's part of what's being fetched... If you check the cache with "modules", you will find the URL listed, next you doubleclick on it and you'll get the whole structure of the site, including the D/L-ed files. This literally means all the files you D/L with CAB are sitting on your system twice!

Hope that clears the bit. Not sure how come your Texteditor was opened for a .ZIP file...

2954. Use of counter with Demon

Newsgroup: comp.sys.atari.st
Date: 1998-11-17 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <365174aa1294c9f1@holleman.demon.nl>
Source record: 89810

Hi,

I discovered Demon offers a free counter service... after reading the relevant Demon pages, I added the relevant line in my Index.htm file and Hey Presto!, my page has got a nice counter.

But: I want another one on my Matrix page. All the files for this page are in a subdir "Matrix" on my site, including the "index.htm" for that page. So I added the line

<IMG SRC="http://www.demon.co.uk/cgi-bin/Counter.cgi?www.holleman.demon.nl/matrix/index.html"> (note this can't be in one line here)

and next that page shows a counter with "illegal path".

So I called the support site, but the guy didn't know much about them....

So I'm stuck once again...

Should the path read: ......demon.nl\matrix\index.html or
......demon.nl./matrix/.index.html or
......demon.nl.\matrix\.index.html or
......whatever?

The info pages of Demon don't mention the use is limited to just one counter, so...
Also the info pages said these counters work by adding for every item on the page, i.e. say you got an index file plus 10 graphics, then for every visit the counter adds 11. I checked this, and that's not what happens, it just adds 1 for every complete D/L.

Any users with Demon have a solution?

It is PUBLIC DOMAIN because I got it off a magazine disk and it said that it was now in the public domain. I installed it on my hard drive, so I don't recall the magazine disk, but I will try and find it and re-read that documentation that it does have.

I didn't in fact think about that way, going the web search, DUH! Thank-you for the suggestion.

2957. public domain MIDI player for ST (STacy/2)

Newsgroup: comp.sys.atari.st
Date: 1998-11-17 00:00:00 UTC
From: thumper@webthumper.com
Message-ID: <72s770$u3b$1@nnrp1.dejanews.com>
Source record: 89813

I used to have CUBASE for my STacy laptop, but I switched over to Windows/PC and bought CUBASE for Win95.

I would like to be able to use my STacy in our studio to play GM MIDI files that I create on my PC. Is there any public domain or even shareware MIDI players out there for the Atari platform?

I have checked a few search engines for anything and have come up empty...there doesn't seem to be much out there anymore for Atari? Or an I just not looking in the right places...its been a long time since I stopped hoarding all the cool programs for my STacy and Falcon.

Thanks for any help and please reply to e-mail as I don't have a very reliable news feed - besides dejanews.com that is.

Atari's format of 720KB has one big drawback: FAT length is 5 sectors. It
is not just incompatible with PC's 720 KB format, it is waste of space,
since 3 sector for FAT is enough.
You should format your floppyes with some program, which supports PC
compatible formats. Kobold is one of them.

Both sell literally ANYTHING Atari ever made so they will most likely still have Atari SC1435 monitors for sale.

And just because you don't know what you are saying doesn't mean
that GFA Basic 2.0 is not public domain. There's a free version
somewhere but tell you the truth I'm not sure if it is public
domain or some other licence.

There's GFA FAQ at: http://www.geocities.com/Athens/5272/gfa/gfa.htm

Yes. The fate of downloaded non-htm files puzzled me for a long time.
I was forever diving into the cache manager to track them down.

My solution (and there are others) was to nominate the relevant
unpackers as the 'Viewers' for files of type *.ZIP amd *.LZH. This
means I can unpack them when they arrive, while I still have a good
grasp on them :-)

2970. New Atari CD Now Ready For Order

Newsgroup: comp.sys.atari.st
Date: 1998-11-17 00:00:00 UTC
From: deano@zetnet.co.uk
Message-ID: <365ed5d5.9215928@news.zetnet.co.uk>
Source record: 89826

In case you didn't see it in the newsgroups my new CD entitled "The Atari ST PD Collection" was released over the weekend. It contains over 200 meg of all types of PD software including Demos, Games, Music, Internet Software, and Diskmags.

There is also a Spectrum CD which contains over 5000 spectrum games plus Atari ST and PC emulators to run them. All the old favourites are included such as: Manic Miner, Jet Set Willy, Chuckie Egg 1&2, Hypersports, Jetpac, Atic Atac, Green Beret, Mikie and many many more.

Both Cds cost a fiver each plus + ï¿½1ukp P+P UK (Rest Of World - Add 2 pounds) and can be obtained from

27 Turbary Walk
Milnrow Rochdale
OL16 4JN
England

Also availible is "The Megadrive Collection" which includes over 250 megadrive games plus PC Emulators.

Cheques/Postal Orders made payable to D Sharples

You must edit options/external programs. In binaire data you MUST set
*.zip etc.
Every binaire data which isn't set in this or another file will be
displayed in the texteditor.
These are the most common extension you'll came across
*.zip, *.lzh, *.tgz, *.tar, *.gz, *.zoo, *.hqx, *.tos, *.bin, *.uue

If there is no need to it you better don't use Wdialog at all. I don't use
it and I'm able to do almost everything I like. Even print from Cab 2.7
works. I only have used Wdialog once to set up my printer. That's all.
If I must use it for some reason I start it from desktop.

Message-ID: <66269182_000049_OASIS_NEWS@000049-zetnet.co.uk>
Source record: 89831

Thats It now!!!
I'm on a crusade.
Instructions that one can read please??????????

I like my Atari. I am gratefull to and appreciate all the P D Shareware authors
that make the continued use of my Atari possible. BUT I am a computor user, I need intructions that tell me how to USE the program. Take my latest download, OKAMI a News/Mail reader that I am told by no less than Gary Priest the author of POPwatch & NewsWatch is the best there is. So thats good enough for me & off I go a surfing download the files & set aside a night to set it up.HA HA. 6 lots of Docs,7 Lots of MANuals & ST GUIDE. History doc, Great like I need to know that Magna Carta was the 44th revision. Changes.doc,Ok some might be interested...
Next comes HOWTO/soup???????. "Make sure you can run uqwk on your host",It says. As our american cousins would say "SAY WHAT". Next TIN.doc "make sure you run in UUCP mode",EH!!!.TZ.doc "SEt variable=some_string" ?????.
OK well it has has STguide I'll look at that. Waste of time do'nt bother!!!Check out the instalation instruction It says "& I'm not kidding "After instalation ect ect ect " Not how to install at all.
Now I shall keep going till I get it with the help I hope of Gary who has been good enough to send me his O.inf file.
But the thing is that this is not untypical of Shareware instructions "so called" Lots of stuff about how they did it,what they used,who helped them,ect ect & nowt about how to use the damned thing!!.
This is not Documentation it is Masturbation!!!!!!!!!!
Let me make a suggestion to all you programmers out there. When your program is finished(no sorry I know they never are) but when you are ready to release it, Invite roud to your place your wooden headed neihbour preferably the thickest idiot you can find(me if you like). Sit him/her down in front of the computor & tell them how to use the program record all this on tape missing out the "NO the left button you great steamming pillock"bits & publish it as the instructions...

Again I say I admire you all & the efforts you make, I even send shareware fees off.
But You write the programs. without the thick USERS like me there is noone to see your work. Please make it possible for me to use your stuff......
ALB
Pete.

>
>So I'm stuck once again...
>
Well, I tried literally every combo, using slashes and backslashes and
everytime it either complained with "illegal data path" or the image
wasn't even shown. I figure Demon's only allowing one counter altogether.

So I fetched the stuff from Fastcounter.com, applied for a code and after
5 minutes the e-mail came in with my account nr. and code.

So now I've got an independant counter on the Matrix page, this one
doesn't add 1 up at a reload and on top of it I get a weekly e-mail with
statistics on the use of the page... All for free, just having to add a
link to "Fastcounter".

For those interested, URL is http://www.fastcounter.com

Look for the menu entry "extern programs" or "extern viewers" or some
sort. There is a line for binary files. Zip, lzh..., should be listed
here. If not, add them and save the config. Then, at the end of a
download, you should be prompted with the file selector. If you didn't
erase the HD-cache, you can even do it offline.

Maybe you're right. My short answer was half a troll and a bit ironical.
But only half. Do you think there is no piracy with Micro$oft products ?
Is Micro$oft dying because of piracy ?

I really think Atari died because of bad management.

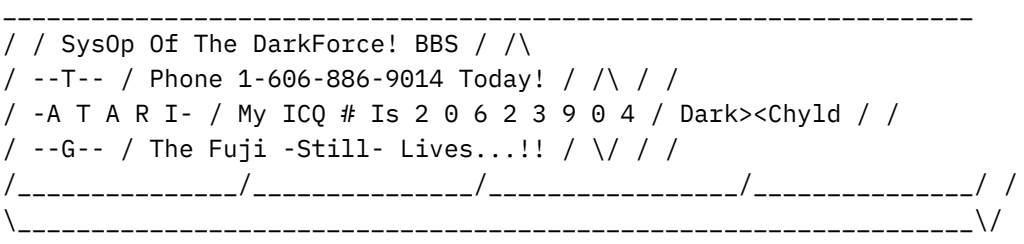
2985. Top events in last 20 years/Computer Shopper

Newsgroup: comp.sys.atari.st
Date: 1998-11-17 00:00:00 UTC
From: thechyld@pcc-uky.campus.mci.net
Message-ID: <72ss5e$mg8$2@news.campus.mci.net>
Source record: 89841

Anybody else read the Computer Shopper? (I read it for the hardware that I can attach to my Atari systems!) Anyways, one of my favorite columns in it is "The Hard Edge". This month, Bill and Alice listed the "Top Computer Events of the last 20 years" (and the worst). The Atari 800 was one of the Top Events... ;-)



2986. FS: Atari Computing Issue #10 with disk $8 delivered in USA

Newsgroup: comp.sys.atari.st
Date: 1998-11-17 00:00:00 UTC

I need to find a Telnet client that conforms to a TN3270 standard.
Supposedly this enables you to tab around the screen, and updates the
whole screen, and not line by line. This is very important.

Thank's in advance

binson@zetnet.co.uk (William Robinson) inquired plaintively:

B > Help needed with files downloaded from the internet which
B > can't be trashed, they are not Atari usable and not recognised
B > in any program I have.

Do they have the 'read only' flag set? This shows in a TOS window as
a triangle symbol in front of the file name. Sometimes downloaded
files have this. Depending on your TOS version, you should be able
to determine and change this from the desktop. Then you should be
able to wave bye-bye to them the usual way.

I've had the INF file close to 4k and Falcon seemed like it wanted to
write a lot of files like this:

C:\C:\file.xxx

The strange thing was I could'nt delete or rename, but I could nest
the file in deeper to :

C:\C:\C:\C:\C:\file.xxx

I finally located the problem to the INF file, and also to CAB.OVL
2.97 or whatever it was.

Just because GFA Basic is above version 3 doesn't mean that version 2 is in
public domain. In fact, the copyright on that older software is as valid
as the newer software. Don't delude yourself.

There are lots of websites on GFA basic...give me a few and I'll point you
to a website or two...

2999. Atari PC Bus Mouse Hack

Newsgroup: comp.sys.atari.st
Date: 1998-11-17 00:00:00 UTC
From: David Jackson <anderon@ix.netcom.com>
Message-ID: <72r6np$nv2@dfw-ixnews3.ix.netcom.com>
Source record: 89893
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Recently, I accomplished another successful hack on the Atari, one which I am quite proud of.

In all fairness, the original document that came as the source for this hack was found on the Atari ST Quick FAQ page. It described how to take a Microsoft Bus Mouse and modify it for use with the ST.

I had a Bus mouse, but not a Microsoft one. In fact, I can't determine what the brand of this mouse is. The back of it reads:
BUS MOUSE
Model No. : TX-2B
S/N: KAM 137351 (I assume this a serial number)

At any rate, from the document, I came to learn that modifying the Bus mouse to work on the Atari is a matter of just switching some pins around. So, I pushed a DB-9 pin connector from Radio Shack, with solder cups, and got a nine-strand cable I had laying around the house.

Solder the wires up, according to the corresponding pins, and blammo! The thing works. Better than my Atari mouse when it was BRAND NEW. Smooth as a baby's bottom.

Anyone interested in hearing more about this hack?

3001. Shareware docs, eg Okami

Newsgroup: comp.sys.atari.st
Date: 1998-11-18 00:00:00 UTC
From: char4101@uni-trier.de
Message-ID: <3652f8a21057a20@uni-trier.de>
Source record: 89695

Hi, Okami users!

The okami docs are really a little bit difficult to understand, especially
if you are not familiar with unix, pop, SOUP, and so on.
But it really is _almost_ sufficient if you know what you do ;)

The problem most of the users have is, that you _MUST_ have uqwk running on your
host in order to handle SOUP packets! So, this means you need access to an
UNIX-like machine.

Okami needs to be feeded with import-data, which can be in different versions.
In my case, I use uqwk to _export_ my news (mail is possible too) with SOUP from
the host.

If I write news-articels (mail is possible too), then I have to _export_ them
via Okami. Now, this data has to be imported on my UNIX host.

Normally, the data gets SOUPed. But In my case, my UNIX machine does not handle
imports of news in SOUP format (even though mail imports work).

So, this is the point, where NEWSWatch is needed. Fortunately, Gary has integrated
a NOS compatible interface, so instead of letting Okami export my data in SOUP-mode,
I make my exports in NOS-mode. And these exports can be posted directly to my
newsserver by NEWSWatch.

There was just one problem left, which I solved with Gary Priests help:
NEWSWatch needs NOS compatible data, but my Okami (better OEXPORT.TTP) could not
generate it. So I discovered Jos den Bekkers Okami version, and I took his
OEXPORT.TTP, which has an integrated NOS-mode.

Sounds quite complicated, huh? Well, actually I needed some time (and help by
other Okami users) to get it right. But now it works nicely.

Ok, that's all. Bye, MC.

PS: as I mentioned, there are at least two branches of Okami development.
Starting from the original version by Wolfram Roesler, the german
version by Michael Schwingen, and the dutch version by Jos den Bekker.

3005. Re: ICD & Hard disk Problem, help needed

Newsgroup: comp.sys.atari.st
Date: 1998-11-18 00:00:00 UTC
From: atarist@xs4all.nl
Message-ID: <72v5ukaca2@news2.xs4all.nl>
Source record: 89699

I hear that complaint more: something goes wrong with external units.

Sometimes the problem can be: an earthing-loop.

If all units get main power and EARTH and also between the unit goes
a cable that carries 0 V AND EARTH (that is mostly the case) then you
have a circle.

So my advice: check to see that the metal frames of the units contact
each other through the (SCSI?) cable. If this is the case:
Then plugin the main-power of each unit without EARTH.

There is also another possiblity: the earth-loop is inside the
connection cable (when it is a round one).
When in the cable there is a wire going for 0V (and earth) then the
outer metal casing of the cable should not be connected on both sides
to earth but only on one side.

Met vriendelijke groet,

Of course... No.... :-) .
There is many way to make software more efficient. One is if programmers better cooperate...

>Look at the PC platform they have many programs for a very low price
>are they better ? naahh...
>To get software out on the market fast they often use differnt tools
>to make the software and this makes the software very BIG
>and they do not hav fully control over the code.

Yes, PC programs are mostly too large, what I don't like. Software market is same like we, people: quantity is beyond quality.
I program mostly in assembler, what produces shortest code. And Intel '86 assembler is not so easy to use, as 680xx assembler (my opinion) .
>...
>Yes the number of Atari users are low but the platform is not dead yet
>and as long all pays for the software that are not free.
>I think it will continue to live as it is a very stable platform.

Hmm, my opinion is that Atari's future is in emulators. All Atari clones failed due to high price in compare to PC platforms.
Yes, there is a lot of free, and high quality software for PC. Perhaps best example here is Pacifist.
And I use often Gemulator 96 or 98 demo. Only few, unimportant feature is disabled, and I don't see any reason to pay for full version. And it works around 15 times faster than ST, on my K6 platform. I suppose, that it is even more compatible than some new Atari compatibles (?). This is perhaps interesting theme for new discussion ?

I partly agree with you. Magic is surely unreliable. It hangs too much on
the hardware. Does it work on the Hades? Nope unless you use a special
version, Does it work on the Milan? Same answer. I also have understand
that MagiC on the Falcon is sometimes a mess. Depend from Falcon to
Falcon.
Geneva works on every Atari, from a ST to the Hades. I don't know about
the Milan but as Geneva works on the Hades I think it works on Milan too.
On the Hades Geneva has proven to be a little bit unstable especially if
one load MiNT on top of it.

There is also N.AES/Thing which works also on every Atari but it needs more RAM,
(AFAIK some 2 MB). It works perfecty on the Hades and Milan.

I'm been using Thing since version 0.59 I think. I never, never have
encounter such a problem. I've used Thing with Geneva and now with N.AES.
I also have a registrated version of Jinnee but IMHO Thing is far better,
especially if you use MiNT Thing has proven to be very useful.
In the past I also have used Neodesk (sometimes I still use it), Nodesk
(lovely desktop which was far ahead of his concurrents at that time),
Gimini, Teradesk.
With all these desktops I never had serious problems. When I had one it
was mostly my fault.

3010. U.T.S.I : the ultimate bye bye

Newsgroup: comp.sys.atari.st
Date: 1998-11-18 00:00:00 UTC
From: dipching@ping.be
Message-ID: <36532794737da0@ping.be>
Source record: 89704

You must be aware that the U.T.S.I, Ultimate T.O.S Software Index will
end right now ...
Directly, you'll not be able to connect at the old places :
http://www.ping.be/pin10575/PRG-IND.HTM
http://ping4.ping.be/dipching-drulkhor/PRG-IND.HTM

However you can always access the very "ultimate" version of the U.T.S.I at:
http://www.geocities.com/Tokyo/Temple/9537/PRG-IND.HTM
But ... this web site won't be updated and I really don't know how many
time it will stay there, though I have a free web space there, only my
"tibetan related interest" have the requested logo from Geocities ...

You can do what you want with the U.T.S.I, but not with the rest of my
pages which are rather personnal ... :)

I want to thanks anyone who supported me or my work during the
last two years ... especially:
-Martin Byttebier who did my genuine atari connection and always
supported me even in the badest moments.
-Neil Roughley for his endless help and extremely fineness.

Also a lot of people who became my friends along the years ...
Thanks to anyone ...

I don't project to come back but it's not impossible ... the next
days, weeks, months or years will bring my next life ... to happiness
... I hope and I will now work for that.

I want here to send to everyone thousand golden wishes.
Have a good life. Begin your best year.

Sincerely yours

Jo

P.S: My email address will stay open until the end of the November month,
so if you want to contact me I only will be able to read your words until
this date.

Viva Atari Mania !!!!!!!!!!!!

if anyone knows the guy who bought a roland cm32l sound module
from me at the stafford show please ask him to get in touch
as i have some docs on paper about the gm emulation software
i included with it,and it is doubtfull that he will guess how it works

we met at a stand that Vic Lennard was on and then went over
to th A S P stand where i had some things for sale on the floor
just in front of the stand

Hi Marshall. No problem-here it is:

(note that there is no number "11" in either columne. This is the way it
was, straight from Computer Shopper-so much for proof-reading, eh?) ;-)

(Oh, the Atari 800 was number 19, not 18 like I posted earlier-but its
there!) <smile>

Top 20 Events of the last 20 years.

20. The Apple II
19. The Atari 800
18. The Commodore Pet
17. The TRS-80
16. The IBM PC
15. VisiCalc
14. WordStar
13. The Macintosh
12. The laptop computer form-factor
10. L2 cache
9. CD-ROM drives
8. The Web
7. Digital cameras
6. The color Inkjet
5. The Sony Playstation
4. Desktop publishing
3. $899.00 PC's
2. Doom
1. "The Hard Edge"

Bottom 20 Events of the last 20 Years.

20. The Lisa
19. The 386SX
18. The Macintosh
17. IBM
16. The "home PC"
15. The integration of peripherals on motherboards

14. Proprietary anything on a motherboard
13. Riser cards
12. Processor upgrades
10. Packard Bell
9. No L2 cache
8. The Web
7. The Pentium Pro
6. The Internet PC or network appliance
5. The return of Steve Jobs to Apple
4. OS/2
3. MMX
2. The Celeron
1. The shorter "Hard Edge"

Enjoy! ;-)

>from newswatch, and that's it. I agree, it looks like a very powerful
>solution, but really has bad docs.
>
>
Well, my few cents on the matter:

First, I agree that some programmers could take more effort in writing
docs about their programs as seen from the users end.
OTOH, some users like to see more extensive docs, where other users just
wanna see basic docs.

Secondly, I disagree on "Okami having bad docs". It has lotsa docs and the
problem for the user in general is filtering out all unrelevant stuff.
Take me, for example. OK, I'm no newbie, but regarding SOUP, QWK, NOS
stuff I also react with "Say what?".
I fetched Okami, started reading and the very first impression was "Good
Lawd, this one's gonna take hours. After reading more I got the impression
I got lost somewhere. Then I understood I needed POPwatch and NEWSwatch
too, so I fetched those too and read their docs too. It cleared a lot,
especially about the NOS stuff. What I basically distilled from it was
that I needed a NOS setup for Okami. So, I could forget about SOUP, TIN
and all the other "abacadabra".
Then I read Okami's docs again, especially the O.INF stuff. It's not bad
at all, it says what items MUST be specified and which not. It DOES need
carefull reading!!! After around 3 hours I had the several INF files
completed, according to what I thought they should be and the only problem
was the SEQUENCE.SEQ file which wasn't there and even that turned out to
be "read the screen message", so I simply created a zero byte file (this
problem doesn't exist any longer). Don't wanna broach, but Okami ran on
the first trial and it did the job as it should. Finetuning all came later.

One should indeed consider that Okami was programmed to run with other
software, hence the SOUP/TIN/UQWK/NOS stuff. It still does, but for the
"regular Atari Internetter" only the NOS stuff is relevant, so that means
setting a NOS installation and defining NOS im/export in POP/NEWSwatch.

Perhaps I had the advantage of having installed my point software years
ago, but I still stand by what I've said before: if one can install Sting
and get it running OK, Okami shouldn't be trouble too!

David, IIRC my Cubase 2.01 (?) didn't like the NVDI I was running then
(2.5?). It didn't like much else either, especially on the accessories
front. So I never used NVDI together with it, also because I started it on
a one meg STf and needed all available memory.

But I hate to run my ST and TT without NVDI, even under MagiC. In case I
have to, I think: Christ, we've gone back to 1985 when this was fast...
Thank God it's 1998...

What is "The Hard Edge" ?

I'm surprised to see just The Web on the list and not The Internet. How could The Web be considered a bigger event that The Internet? Maybe the people who devised these lists consider the two terms interchangable?

There's that "Hard Edge" again?

This bottom list seems odd to me. There are a lot of things on there that I don't understand why they're on there.

I'm surprised that Microsoft didn't make one or both lists.

3017. MagiCMac Demo Problems

Newsgroup: comp.sys.atari.st
Date: 1998-11-18 00:00:00 UTC
From: roughley@HORMEL.unix.dsoe.com
Message-ID: <1diowj8.so4mhy1k6hcq0N@slip152.dsoe.com>
Source record: 89711

I originally posted this question to the MagiC list at onelist.com but received no answer besides a reference:

Can someone please tell me why the latest German MagiCMac demo 'suspends' both Photoline and Cranach Studio? The programs load but aren't accessible from MagiCDesk. The other programs I've tried (GrafTool, qed, CAB) work fine.

I've used FPUPATCH.TOS on the Photoline and Cranach executables but nothing is altered, so they should run in their original state.

Why would MagiCMac suspend (as reported by its program manager) these two programs? I've tried the ST and TT executables of each program, of which run fine on a TT using MagiC 5.11.

Any help would be appreciated.

Message-ID: <36534a01.0@news.ptw.com>
Source record: 89712

I just had a talk with the tech at my isp, and he said it seems that STinG is not sending the right commands that work with the new boxs they have.

He used a lot of stuff I don't understand, but they are now using the Easy Access software/hardware and that they are using the right way computers are suppost to use. That STinG seems to not use the 100% right way of doing it. In about 2 hours I'll know one way of another and if it's like what he says, I'm doomed to look for another isp that I'll be able to use.

anyone want to tell them something, just send it to:help@ptw.com

Any recommendations for good typing-tutor programs (freeware/shareware) for the ST/Falcon? I've found a few on ftp sites in the past; these are:

*Typtutor V2.0 (filename: TOUCHTYP.TOS)

*Typist (filename: TYPIST.TOS)

*Type Tutor (filename: KEYBOARD.PRG)

So, are there any others out there?

Actually, I'd go higher than that. Just a couple of games and a few things from ASH don't work (hmm, wonder why?). One big annoyance is that Infopedia has display problems under Geneva, but other than that, I hardly ever turn it off.

Quite likely, it's frightening the number of people who don't know the
difference. OTOH the Internet was around for quite a while without taking
off in any kind of explosive way until the web came along and lit the fuse.

> > 1. The shorter "Hard Edge"
>
> There's that "Hard Edge" again?

Lord knows what it is.

> This bottom list seems odd to me. There are a lot of things on there
that
> I don't understand why they're on there.

I can have a stab at some of them:

> > Bottom 20 Events of the last 20 Years.
> >
> > 20. The Lisa

Too slow and expensive to take off. Though arguably the Mac and GUIs etc
exist because they grew out of it, so it seems a little harsh to write it
off.

> > 19. The 386SX

Crippled chip.

> > 18. The Macintosh

Sheer prejudice, I reckon: the Mac is one of the most influential things to
happen in the time period.

> > 17. IBM

Silly people who lost the plot, and the trade.

> > 16. The "home PC"
> > 15. The integration of peripherals on motherboards
> > 14. Proprietary anything on a motherboard

Presumably the beef here is to do with limiting hardware options. OTOH if you get the stuff right, it shouldn't matter, as Atari users are well aware.

> > 13. Riser cards

No idea.

> > 12. Processor upgrades

Of dubious value unless all the other bits of the machine can cope.

> > 10. Packard Bell

Overpriced, underspecced but widely available PCs.

> > 9. No L2 cache

Cripples the chip and some software doesn't like being without it. PC thing.

> > 8. The Web

Rarely lives up to the hype, let's face it. How many times have you heard people's reaction to using it for the first time to be "It's slow, isn't it?".

> > 7. The Pentium Pro

Pointless cul-de-sac in the "development" of Intel processors, ditched rather unceremoniously in favour of the PII.

> > 6. The Internet PC or network appliance

Presumably this is here as it was much trumpeted but has yet to make much of appearance.

> > 5. The return of Steve Jobs to Apple

Supposed to wave a magic wand over the company, not clear if it's worked. (That should start a few arguments. *grin*)

> > 4. OS/2

Close but no cigar.

> > 3. MMX

Intel performance enhancer which doesn't seem to have had that much impact (?).

> > 2. The Celeron

Crippled chip.

> I'm surprised that Microsoft didn't make one or both lists.

Probably too busy losing in court...

The "c't Magazin fuer Computertechnik" had a DIY project to add a user-port,
with the software for turning it into an IEEE488 later. It wasn't for the
MegaBus but the cartridge port.

This was about a decade ago.

Why do you call STinG "rather larger" ? Given the fact that the Dialer does
not need to stay resident, STinG can be used with less RAM than STiK !

I'd go as far as saying that it's hardly possible that STinG can't do
where STiK works.

So I can only deduce that you haven't tried very hard. :-(Which is
strengthened by you saying :

> The "faster upst.." is faster, 5k a second in CAB. Examining log in
> reveals a new line.. "your annex address is" what is an annex address?

Do you know what an "annex" is ? And do you know what an (IP) address
is ? So what's an "annex address" ? To me this indicates that you haven't
even tried to adjust your login script. Obviously you're one of the folks
who think configuring is nothing that needs to be bothered about. Sorry,
dude, but the world doesn't work that way.

Cheers Peter

PS.: Sorry if this sounds a bit upset, but I can't stand people who ignore
configuration, and then blame all the trouble on the software.

You get through well. I don't know what your problem is, I'm not even
sure if the above was meant to explain the problem. ;-)

Best send me e-mail with a precise description, and add DIAL.SCR and
DEBUG.LOG (generated as described in the docs). You'll understand that
calling you is a little too expensive; if you wanna do it (it's cheaper
from the US), you find my number in the docs. ;-)

Cheers Peter

> Or is there just some basic incompatibility between NVDI and STing?

Yes, and no. FSerial is not a good replacement for HSMODEM. HSMODEM offers
more than FSerial, and is incompatible. You could do without either, though,
but FSerial is not an option for STinG.

NVDI is fine in every respect.

Are you sure you aren't confusing a couple of things ? IIRC 3270 is an
IBM mainframe, and the above the "standard" to connect to such machines.
While it's of course possible that this fulfills your description, it is
not the only, and not even the generic one, that "enables you to tab
around the screen, and updates the whole screen, and not line by line".
Any decent Telnet client should do this on the basis of VT emulation.
For STinG, try TelStar for a "half-way" emulation (only the most important
bits) of VT100, or TelVT102 for a full VT102 emulation. Of course the
remote must be able to talk VT100, but virtually all do that.

I was amazed by the the lack of any mention of Atari except in the "hard edge".
I'm tempted to write a letter of displeasure to the editor. The first palmtop
award went not to the Portfolio but to the HP 95LX which the same magazine stated
'introduced MS-Dos to palmtops' the first CD Rom drive for a commercially viable
platform went to a PC Brand not to the CDAR-504. CD quality sound to SoundBlaster
not the Falcon. I won't even mention MIDI (which JUST became available in a
widely sale-able card SB-Live) WorkerStations (ATW 800) running Unix, Graphics
Tablets, Joysticks, First large scale use of a mouse, Trackballs, Hardware
Blitting, First Company to break the 1 Meg for $1000 barrier, First widespread
color GUI, and lastly the first low cost commercially available modem.
I could go on, But I could write a book. (maybe I should But would anyone buy
it.)
Well I spoke my piece

3036. Use pc floppy drive in st?

Newsgroup: comp.sys.atari.st
Date: 1998-11-18 00:00:00 UTC
From: Mikael Nilsson <sysop@linux.nu>
Message-ID: <36520B51.51705500@linux.nu>
Source record: 89759

I have just found my old atari st!!

Well i tried it and it did work so i thought i should download something
fun...
I started my pc and found some cool pd stuff on the net . So now i only
had to load the programs on disks and transfer them over to the st...or
so i thought.
It showed up that my nice little st only have a single sided floppy :(

So the problem was that my st couldn't read the 720k floppies i made on
my pc and
my pc couldn't read the 360k floppies made on my st.

Well after searching the net for info i found quickfaq, aha i can use a
floppy
drive from my pc and put it in the st.

Get the screwdriver and pull out a floppy from a pc...
Hmm i need to change a jumper...but this floppy drive doesn't have
jumpers...hmm
lets try anyway :)

"Connect the cable upside down" hehe piece of cake...NOT
My f*cking pc drive have two rows of pins...and my st floppy cage only
one!!

So now im stucked again...i suppose i can't use that ps floppy drive,
can i?
If anyone have any ideas what to to please tell me...i want to use my
st.

Tn3270 is the IBM mainframe terminal emulation program. Most Telnet programs for the Atari use the DEC VT100, VT200, etc. terminal emulation. There are many TN3270 programs for Windows but I have never seen one for the Atari.

Our company uses TN3270, but we also have a Web site that translates TN3270 to html so I can use Cab to talk to our mainframe. Its a program from WallData Corp.

I'm sure someone could write such a program -- but there seems little interest. If we could get enough TN3270 Atari users together we could perhaps afford to hire a programmer. I'm sure that IBM publishes the TN3270 specification.

I need this for professional reasons. I have a branch office of a brokerage firm. Our back office access, and order entry uses the TN3270 protocol. Rather than have to go out and get another windoze based PC, I was hoping to use the ST I had laying around. I thought it would be a good dedicated terminal for the telnet program. If there are any programmers out there that could or would be able to implement this protocol for use with STing please e-mail me, and maybe we could work out a deal.

Thanx's

The second set of pins is to chain another floppy. This is similiar
to the Amiga. I believe DOS takes the first floppy and names it A:\,
the second B:\and so on. I've tried to use these drives with no
jumpers on both my Amiga and ST. I've gotten them to read disks, but
they won't recognize a disk change. I even tried to use the program
FMC.PRG (force media change) but it still wont work. Has something to
do with the way the ST reads a disk change, and the way a PC does

That's because it is. See below for the correct tag.

>So I called the support site, but the guy didn't know much about them....

No comments...

>So I'm stuck once again...
>
>Should the path read: ......demon.nl\matrix\index.html or
> ......demon.nl./matrix/.index.html or
> ......demon.nl.\matrix\.index.html or
> ......whatever?

None of the above. If you've already got their counter working, you
already know the URL for it. Just as a memory jogger, the HTML tag is:

<IMG SRC="cgi-bin/counter?a" ALT="[counter]">

BTW, the '?a' defines what the counter is displayed as, and can be
anything between '?a' and '?q'. They've even got a special one, '?x',
which is a sort of Christmassy (sp?) one with the counter digits
displayed on baubles.

>The info pages of Demon don't mention the use is limited to just one
>counter, so...

They only provide one counter, which is a pity. If you're only wanting
to check one part of your site, just place it on the index.htm of the
part you're wanting to check. If you're wanting much more than that,

there's no easy way of doing it without using external counters/logging.

>Also the info pages said these counters work by adding for every item on
>the page, i.e. say you got an index file plus 10 graphics, then for every
>visit the counter adds 11. I checked this, and that's not what happens, it
>just adds 1 for every complete D/L.

That's how it should be. The counter is only incremented when the browser
sends a request for counter.cgi, not when a request for anything else is
sent. For that purpose you'll need some form of logging script, which
Demon don't supply, but others will.

>Any users with Demon have a solution?

Not really a solution, but you might like to pay a visit to

<URL: http://www.atomor.demon.co.uk/>

and have a look around. There's a nice set of pages with quite a few
tips and trick for Demon customers, including a complete page explaining
about counters, what each one looks like, and how it's called.

If you're still needing some help, get hold of the homepages faq from
<URL: http://www.ccgadv.demon.co.uk/faq/> or you can try asking in
demon.homepages.authoring.

Double check that you're using the right components of HSModem, point all
your configs to "modem 2" and you should be fine.

I didn't say so.

> Is Micro$oft dying because of piracy ?

Do you want to compare the Microsoft market with the Atari market? This
is something so completely different that comparisons don't make any
sense.

> I really think Atari died because of bad management.

And who are those that do bad management? I can only see companies
trying to survive in a small market. As soon as profits drop too low
they have to quit. And stealing software instead of buying it means that
less profits. If you have to earn your living from developing software
for the Atari and you don't make enough profit you will leave the
market. You have no choice.

Thanks to all for assistance. It looks as though some further
info is required.
The files are all read write enabled
The dialogue box "cannot find file" is shown.

Running a F030 machine with TOS4. I cannot get Diamond Edge
to recognise the files and I have tried correct prg with no luck
I have run CAB and CAB ovl 1.311 for 3 months with no problem of this
sort till now. The files take up little space and as yet create no
other problems and my essential prg's work fine, it's just annoying
not having full contol over my system.

One file in question, and by the looks of the extension is for
use on another platform, is called ANGEL.CTE

optimizing a 100m zip cartridge with the same problem caused corruption
resulting in large amounts of lost data.

And the unregistered version of Thing has only a few items disabled -
way good enough to try out.

I'm currently using it unregistered while waiting to try out Jinnee, and
will then register whichever I decide on.

Teradesk is the only free replacement I know. Old now, and not being
developed, but still better than the Atari desktop, I think.

As for Magic versus Geneva, all the programs I use work fine under
Magic.

Definitely not. The atari.org domain web forwarder is absolutely screwed
up. The real address for the Quick FAQ is :

http://www.multimania.com/bales/quickfaq.htm

Please use this until the atari.org domain gets repaired. I'm sorry
about this mess, but it's not my fault.

I'm afraid I have to agree 100% with you. After hearing so much about Okami/newswatch/popwatch, I decided to take the plunge and was absolutely unable to get it to work. I finally ended up getting one post from newswatch, and that's it. I agree, it looks like a very powerful solution, but really has bad docs.

To be fair, Okami was never actually written to work with POPwatch or NEWSwatch, and actual NOS support was put in by Jos when he took on development of it. I think there is a *lot* of legacy stuff that is nothing to do with Jos. Also Okami handles *so many* different formats not just NOS.

I must admit I found it a bit daunting when I first tried to configure it, and I'm actually an Analyst Programmer for a software house.

I am keen to see Okami/POPwatch/NEWSwatch take over the world (in Atari land), so if anyone is interested in this combo, and has problems with setting it up then email me and I'll see if I can help. I already sent Pete my O.INF and other relevant files. I'd actually like to do a proper set of incstructions for the setting up of all three, and make it idiot proof. So any ideas, let me know.

>software, for lowest possible price.
Do you mean that the programmers shold do a big job on
the software for nothing ?
Look at the PC platform they have many programs for a very low price
are they better ? naahh...
To get software out on the market fast they often use differnt tools
to make the software and this makes the software very BIG
and they do not hav fully control over the code.

>Sadly, by Atari it is almost impossible - count of users is too low.
Yes the number of Atari users are low but the platform is not dead yet
and as long all pays for the software that are not free.
I think it will continue to live as it is a very stable platform.

There is lot of good software for Atari that is free
this cause of nice programmers (like me) likes programming
and loves the Atari platform.

At my work i am working with programming all days long
so i am doing the coding of my softwares when i have the time.

Have you tried renaming the files in question? Its possible the files have an illegal filename that the system can't recognize which could be causing your problem.

3061. SPAWNER 1.40 released

Newsgroup: comp.sys.atari.st
Date: 1998-11-18 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <3652bd96679a70@the-gap.demon.co.uk>
Source record: 89784
Cross-posted to: comp.sys.atari.st,demon.ip.support.atari

Just announcing version 1.40 of SPAWNER is now available from my web site.

This version now works with MultiTOS (previous versions didn't), and when running TOS programs under MagiC they are now correctly run inside a VT52 window.

SPAWNER is a small program that can be used to launch multiple programs in parallel or sequentially, and it understands VA_START.
The main use I have for it is to run it automatically from STinG's LOGIN.BAT, which then allows POPwatch and NEWSwatch to automatically be started upon connection to the internet, and email and news is retrieved effortlessly. I guess it's probably got lots of other uses too :)

Hi Tim

In a word - Yes !

I have used NVDI 2.5 and 3 on a Mega ST with T28 accelerator and STe, and now version NVDI 5 on the Hades, with Cubase 3.x and Cubase Score 2.x

I am not sure how much it speeds up screen drawing on the Hades, but the other machines were greatly improved.

It won't give Cubase better font handling, however, you are stuck with
that the way it is.........

Newer floppy drives are usual default set as drive B, how PC requires.
Using them on ST requires intervention on cable, or on board.
Other problem is drive change recognition. It probably won't work on ST
with most of new floppy drives.
Solution is possible, but requires some additional logic on drive.
I think, that best solution would be, if you try buying some second hand
original Atari drive.

Bad management is of course main reason. I know it, I liv in Yugoslavia
:-) .
Microsoft is also pirated, of course, especially here in Yu. I'm not
Microsoft fan, but must tell it: unlike some Atari programmers, they still
distribute. Microsoft published here local versions of their most popular
programs with lower prices than in 'reach' world.

-
-Oh yeah, I HAVE to find a way to speed up that dratted mouse pointer!
-
-Any help on any of this would be much appreciated!

Hi Gareth,

For screen redraws and and a faster mousie try Warp 9. I use it and am very pleased with it's faster screen redraws and the mouse accelerater is nicely configurable. I'm using it now on my Falcon, but I also had it on my ST where it made a nice improvement. You can hook up an external SCSI unit to your ST with an adaptor by ICD called the Link. There are a few versions out. Very simple to do.

Hi again Kevin,

Well, I finally got around to plugging in my LOG3 dongle. I booted up:
Newsie, CAB, Pagestream, WordWriter, Sysinfo, AudioTracker, EditTrack,
X-or, ST-Guide, Stupido, Zorg 211, Flash and they all booted up fine. I'm
using Nemesis on "High" speed. I have the version that runs at 24mhz
(instead of the newer version that runs at 25mhz, altho I doubt that has
anything to do with it). I'm using TOS 4.04, Warp 9, and a pretty stock
system outside of Nemesis. I suspect you must have something else that
doesn't like the dongle... an accessory, CPX, maybe a screen enhancer?? I
dunno! Try turning off all that stuff and going back to as close as you can
to a stock machine and see what happens. Can you give any more info on the
problem to help us help you figure out what's going on?

Good luck,

Clayton Murray

Memory is cheap now, so large programs don't matter as much as in
earlier days. But you're right that some programs are too large for what
they do.

> assembler is not so easy to use, as 680xx assembler (my opinion) .

That's probably true. On the other hand assembler is the language with
the worst error checking. Compiler languages usually produce larger
programs but they don't have errors that are common for assembler
programs. And with languages like Java (though Java needs a lot of
memory) there are much less sources for errors than with other
wide-spread languages. That's one of the reasons I like Java a lot.

Under STing miscelaneos configs, make sure you have "run default route through port" checked. I transfer the same STing setup from my STe to my Falcon and all I needed was to have that little box checked off.

For regular ST with only 1 or two megs of ram, you cant beat
terradesk. Actually, I don't know how anyone can use an ST without
it. It has all the features of TOS 2.06, takes up less than 100k,
allows you to change desktop fonts, allows you to use a different
desktop viewer, uses drag&drop (a brand new feature in windows 98),
and the best feature of all, allow you to assign more than one
application for a program.

It could be *.PNG graphics, or if you have your advertising filter
set, they may have changed the name of the file to something getting
screened out by the filter. I'm glad it isn't there, it makes yahoo
alot faster. I've already seen the logo and don't need to see it
again.

You can get the LINK from ICD and connect about anything SCSI to it. Don't get any drives from Syquest cause they are out of business, and Iomega products suck. You can call the Mac Zone and get an external 2 gig SCSI for under 200 USD. There is no easy way to put any internal drive into the ST, I think the TUS in england has a kit though. Before you spend any money, check out the guy in this NG selling a Falcon for 350 dollars. I believe it already hads a HD and 14 megs of RAM. Since the Link will cost you 100 usd, and a external HD 200 usd, for 50 USDF more you get 10 extra megs of ram, a 16 mhz processor and a 32 MHZ DSP chip. You can use this machine for D2D recording. Considering the Falcon runs at 4 mips, and the ST at 1/4 mip's you may want to check this out. The Falcon is compatable with most ST programs and there are ST emulation programs that make about 90% compatable. On top of this you also get a 640x480x256 color display istead of a 640x400 mono display. You can even surf the net and play doom. It'll cost close to 1000 USD to bring the ST up to the Falcon's spec. 350 dollars for the falcon is a good deal.

I have the following Atari ST (Sierra On-Line) games for sale.
All of them are in mint condition, in the original boxes with instructions
and any "extras" the games came with.

Romancing The Throne
The Black Cauldron
Camelot - The Search for the Grail
The Colonel's Bequest
Gold Rush
Codename: Iceman
Police Quest 2 - The Vengeance
Mixed-Up Mother Goose
Manhunter
Manhunter 2
Space Quest 1 - The Sarien Encounter
Space Quest 2 - Vohaul's Revenge
Space Quest 3 - The Pirates of Pestulon

I'd like to sell them all as a group, but will discuss other requests.
Please e-mail me with any offers, but don't forget to remove "NO_SPAM_ME" from
my e-mail address first!

This is the second recent post about such a protocol.

Basically, people just need something that handles TN3270.

I recall one such post _explicitely_ stated that Telnet was _not_
an alternative. They need a terminal that is TN3270 compliant to
access their employer's mainframe, using an Atari.

At last we agree in something :-) .

Better error checking in assembler is probably not possible, due to its nature. Of course no language, which could correct even a small part of errors in algorithms and similar.

I don't think its CAB at all. I had the same problem when I was using CAB
and STing together with the CAB-for-STik/STing OVL file. Now that I have
switched to Mint, and am using the CAB-for-Mint OVL file, the graphic for
Yahoo comes in just fine (faster, too). So its MHO that its not STing or
CAB but the OVL file... ;-)

The first preemptive multithreaded multitasking OS - Amiga 1000
First true multimedia machine - A1000

Everyone would write this list different depending on experience and
preference, to prove that just post this list in comp.sys.acorn.advocacy
and see what happens.

To single out any particular platform is unfair, largely because every
platform ever released has contributed in some way to the advancement of
computer technology.*

I'm sure we can all agree on that.

Regards,

Clockmeister.

Actually, I don't, since you list typist.tos on there. But it might
interest folks to know that Typing Tutor/Word Invaders (Academy
Software, 1985 - commercial) works fine on a TT. Really.

Not that strange I think. I do know some guys who are using this to get a
pre-emptive multitasking system instead of the co-operative system Geneva offers.
Jo Vandeweghe has used this for more then a year. He used it to get on the
Net using MiNTnet which is still the best for internet connection IMHO.

>
>> (AFAIK some 2 MB). It works perfecty on the Hades and Milan.
>
>Yeh, thats no probs when ya getting 64mb RAM :)

For the moment I've 32 mb onboard of my Hades of which some 24-26 mb
-depending of the configuration I use- are available for other
applications. Withing a few days I'll expand the memory to 96 mb though.

>I only have 1.5mb free RAM on my STe now, and that's from a 4 meg machine
>:)

The memory comsumption depends on what settings you've made in N.AES.CNF.
Also Thing eats a lot of memory. Jinnee for instance isn't so memory
hungry but isn't so good at all.

The only thing I loose with Freedom 1.5 on (MiNT) VFAT partitions is the
last column (---- Fo, ---- Te, ---- AL, etc..). The date and so are still
there. This is because I don't use some parameters for the long file name
I otherwise uses for 8+3 FS

What do you use in *freedom.cnf* for Format-Strings (For FSe with long filenames)?
Mine is like this: #LONGFORMAT
%-20N%9P %2D.%2M.%2Y %T%h:%m
If you add this to that line the last column will be there too:

%A%Z%H%W %X

3100. Calligrapher Gold - Restrictions

Newsgroup: comp.sys.atari.st
Date: 1998-11-19 00:00:00 UTC
From: mike.borsley@zetnet.co.uk
Message-ID: <731tsh$r3r$1@irk.zetnet.co.uk>
Source record: 89673

I bought Calligrapher Gold at the recent AC show Stafford.

Having installed it I find find it works fine, except it requires the Master Disk 1 to be inserted each time the program is loaded, advising the user to register when presumably a key would be given to avoid having to use the master disk at start up. The registration card is still with the manual.

I didn't have to do this with Calligrapher Pro given away with ST Review, so it seems a bit odd with a full blown package.

It won't allow me to use my back up disk 1, so presumably there's some bootsector code in the master disk. I use the program quite regularly and am a bit concerned if anything happens to the master disk after regular use, I've got a problem.

I did contact the previous owner who advised me that he had bought it in a job lot and not actually used it.

Its a bit late now to register with 'Working Title', can anyone suggest a solution to this or possibly mail a key or whatever is used. Ideally I would like to be able to boot up straight from the hard drive but if this isn't possible, is there a way to copy the Master Disk 1 that will include whatever it needs to start the program?

TIA for any replies
Cheers

I missed the start of this thread, so this may have been covered, but have they installed the new V90 standard modems ? If so, I suspect you will find that your modem needs upgrading. Once that is done, you can get rid of a large chunk of the Dial Scr file. (Others in the group can tell you which bit !)

Zetnet have a number with these faster modems on, and I would have to upgrade my modem to make use of it, but most folks seem to think the connection is too unstable as yet.

Something else you have probably covered - were you on SLiP and now going to PPP ? If so, you do not need the last section of your Dial Scr. (The bit about "Your IP address is" etc)

Hi Paul,

I was looking for typing programs also at one time. There's one you didn't mention: "STupido". I had NO idea what that thing was for, judging by the title, but I must have read it in a product description in an FTP index somewhere. Sorry I don't remember where I got it. Also, I can't say which of those programs works best as I have yet to get around to my "good intention" of bettering my typing skills. That'll just have to wait like so many other things. Believe it or not, I USED to be really good at typing way back in hi school, but now I'm back to "hunt-n-peck" method. Oh well...

best regards,

Clayton Murray

Have you tried renaming the files in question? Its possible the files have
an illegal filename that the system can't recognize which could be causing
your problem.

When trying to re-name the file error message "RENAME ERROR" appears

Not only have they gone to the v90, but they have replaced two of
the 3 servers with new boxs that use 'easy access', my model
works with theirs just fine, and I use PPP.

They are telling me that STinG is sending them a hangup command
and then something else. It boils down to that on firday the
20th, I'll be going off line as they are saying STinG is NOT
programmed right for their boxs. I'm using the 3rd server right
now and it gets replaced on friday, so that's when I go offline
and will be until after the 1st of Dec.

3114. Trust W95 kbd to Falcon DeskTopper

Newsgroup: comp.sys.atari.st
Date: 1998-11-19 00:00:00 UTC
From: Jan.De.Smedt@village.uunet.be
Message-ID: <734dff$bn6$1@xenon.inbe.net>
Source record: 89687

Hello everyone,

I connected a Trust W95 kbd to my Desktopper Falcon.

The connection is made with a print called Adaptakey,
http://wwwusers.imaginet.fr/~oxo/systems

I use the Adaptakey driver in the AUTO folder like they say, but
for the kbd to work I also have to use Pascal Fellerichos CKBD Deluxe
with the French kbd table. That way it works in TOS, Magic and N_AES.

My problem:
The Adaptakey driver dates from 1994 and so does CKBD.
It is a AZERTY kbd so I use F.KBD.
The top row keys (with the numbers) have two symbols in the lowercase
position and the keys next to "P" and "M" do not print the right keys.

- How do I get ASCII 045 "-" and ASCII 095 "_" to work properly?
They are next to the BACKSPACE but all I get is "=+" in TOS.

- What about the following characters?
[] are lowercase right next to the "P"
{} under the "9" and "0"
and \ are unreachable (lowercase right "3" and ">")

Does anyone have a correct CKBD *.KBD file so I can get to the keys?
Especially BACKSLASH is important for pathnames etc.

Greetings,
Jan

Hi!

>Junior Office is available for free, it's "big brother" TeleOffice is
>commercial but I don't know what it costs or where you can get it.

TKR doesn't sell it anymore, but only gives it away with a modem on a CD.
But have a look at http://www.seidel-soft.de/ (Software-Service-Seidel; only in
german, I'm afraid). They sold TeleOffice at several Atari fairs in Germany. Maybe ...
(bit later) They will ship it, yes (phoned for another reason and simply asked).

And: A guy over here is working on a new version (driver for fax class 2.0, new
GEM-like dialogs ...). Simply don't know when it will be released ....

>However, NVDI has drivers for TeleOffice so you can fax directly from any
>program that can print via GDOS.

Note, that TeleOffice-faxing via GDOS is only possible using NVDI !5! But I do agree:
>This alone makes it the best package available IMO.
faxing with TeleOffice has never been so easy :-)))

Hey all. Since I got my new disk drive installed (thanks to Nick Bales) I want to explore the ST a little more. So, right now I wanna try one of my favorite pastimes on the ST, BBSing. What I need is a freeware/shareware terminal program that I can run off the disk (I don't have an HD as of yet) and that I can use via my current TOS (not quite sure which version, but it's the original one that came with my 520ST). If you can hook me up with a copy, or send me to a place online where I can order one, I'd be most appricative.

The Internet was growing before the Web came along, but certainly not
at as quick a rate. I like to think of the Web as more of a catalyst
than a fuse lighter.

>> > 8. The Web

>Rarely lives up to the hype, let's face it. How many times have you heard
>people's reaction to using it for the first time to be "It's slow, isn't

True. But the speed can be increased considerably from how most people
access the Web by not loading the graphics. The Web just being there
is a great asset.

>> I'm surprised that Microsoft didn't make one or both lists.

From: Gareth Metford <gmetford@qubit.demon.co.uk>
Message-ID: <V6JwRYAiE8U2EwBm@qubit.demon.co.uk>
Source record: 89739

I use my 1040STE for Cubase sequencing only (I use my PC for recording and I don't want to compromise MIDI timing so I'm sticking to the ST for the time being). I just upgraded it to 4Mb RAM (cost me GBP4 via a www seller: much better than the GBP90 System Solutions are charging!) and am now interested in seeing if I can improve the computer in some other ways too, to make sequencing easier. However, I don't want to spend much money. I understand that there is a program called NVDI available for speeding up screen displays - can anyone tell me how well this works and which version I should get (version 5 enhancements seem to be all about printing, which I'm not interested in). Also, can anyone tell me how easy it is to add an external HD to the ST? And, finally, I really need a new case for mine - can anyone recommend any alternative cases (you can get Mega ST cases from System Solutions - are these any good? Is it easy to change the case? Do you have to buy another keyboard?). Or alternatively, can anyone recommend a source for a new STE case?

Oh yeah, I HAVE to find a way to speed up that dratted mouse pointer!

Any help on any of this would be much appreciated!

If you're running plain TOS then you are only allowed to have hard drive
partitions C-P inclusive. If it turns out that that range will give you
access to all partitions on both drives at once then all's well.

If not then you will have to find a means of hiding some partitions
sequentially - I believe that the ICD utilities disk allows this?

> I'm quite sure there some tips, tricks to achieve this operation (what's
>about the desktop, partitions, names, ...).

Once you've copied the info across that's it, you'll just need to change the
ID of the new disk if required and set termination etc.

You can only use SIMMs on an STE. If it's an ST or STF, he'll have to
use an upgrade board with either soldered RAM or SIMM sockets

Yup - The CyberDen is now a web site - has been for years - In fact, there's a small Atari ST selection in MIDI Hell here and there under various sections. I retired the ST as my music making device a while back. As for Damned Souls - Wow - Yea, that's pretty raw compared to the new stuff - There are 4 other releases and a 6th is on the way. The last two, Soul Reflection and Scorched Blood are more soundtrack/darkwave oriented - then again, you can hear it all RealAudio at the Xorcist site.

Anyways - Yea, time to get rid of the ST stuff. <Sniff> - I'll never get rid of the Mega-II though - Just like my Apple //e, there's a lot of /interesting/ software on it that, well, any emulator just couldn't give justice to.

> Does such a thing exist??

No, it doesn't exist ready made. You'll have to build one yourself,
using the pinouts from the Quick FAQ. The VGA will only be able to
display ST High-res (640x400 monochrome). This means no colours and no
games.

> If anyone has da info, please mail me at:
>
> con@conshoose.force9.co.uk

Sorry, I don't have any 'da' info, just a quick FAQ you might want to
refer to.

Warp9 is commercial software, and no longer supported. Even at the time,
it was a bit slower than NVDI, which has got even faster with later
releases.

Hi,

I'm using MagiC for quite some time now, the only times it crashed was at
the beginning when I started using it. Several old apps won't run with it,
and even then several old apps that I sure didn't expect to run, did...!
Also several apps made MagiC crash until I put 3 LIMITMEM.PRG's into the
autofolder. Since then it's been stable as hell. This TT runs 24 hrs a day
and I've got periods that I didn't need to reset for weeks... And even
then the reset was only needed for another rez or config :-)

Can't say that for TOS, using it only a few hours...

I don't think you'll find that sort of thing ready-made. You'll probably
have to make it up. You can find the Atari pinouts in the ST Quick FAQ,
but I don't know where the Amstrad pinouts are.

3150. Websites, who cares?

Newsgroup: comp.sys.atari.st
Date: 1998-11-20 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <36554ac042888a40@holleman.demon.nl>
Source record: 89606

Hi web-visitors,

just would like to know what other people think of "the average web page".

Now I don't wanna talk about graphics that won't make a page BETTER , I wanna talk about the LOTSA sites I've seen and I needed magnifier glasses to be able to read them.

Personally, I think a font size of 3 (maybe 4) for the "normal" text on the pages should be fine. This would be based on an average font size setting of 10 on your system (such as an Atari systemfont, average TT-font or whatever). So if you want to yell, you can use 5, 6 or 7 for that, not to mention bold style. If that's not enough, use graphics.

At least, that's what I try to use on my pages. I've seen several pages that use roughly about the same settings.

I've also seen lotsa pages, crammed with text and appearently using fontsize 2 (HTML-defined) for it. My card has a nice option to enlarge the screen on a keyclick, but not everyone has this feature. For several websites I really needed this enlarging feature to be able to read them.

So my question is basicly: what should be the "standard" fontsize setting for regular text on a website?

Am I the only one experiencing those sites that are hardly readable?

And please don't yell at me because of my own pages. After somany time I discovered that I had all fontsettings in CAB mixed up:
<VERY VERY SMALL FONTSIZE>
I only found out this morning (!) that I could set different fonts for bold, italic etc. in CAB. This appeared to be a complete wreckage of different fonts, font sizes etc. for all those items, so I'm gonna rework my own pages too... :-)
</VERY VERY SMALL FONTSIZE>

Anyway, I'm just curious about what others have to say on this matter.

It might be best to copy all the "good" files to your ZIP disk and then clear the partition, that will certainly clear out those rogue files.

Better still would be to backup the entire disk to be on the safe side.

La Terre du Milieu, which was France's largest dealer, closed down a few
weeks ago. However there is a new shop opening at the moment, by one of
TdM's former employees. Check out the french newsgroup,
fr.comp.sys.atari for details.

Anyway, the ICD adapter is not widely available in Europe. You'll
probably be looking for a Top Link or a Link'97 adapter from Germany,
which was imported by TdM.

>scroll around to read..

Tony, at least I can say it is interesting.
Well, let me start with considering rez 640x400 and up as "standard".
Let's face it: do you use a 19" monitor to look at from an armchair at 20 feet? I'd say, you'll get a bigger surface, so you can put more stuff on it. So if I had a screen like that, I would set 1600x1200 or so, leave the system font settings at around 10 (maybe 12) and take the extra surface for putting around more windows, whatever. OK, you probably sit back a little more, so make that font size 12-14 (?).
Also CAB offers the option to set the font size for its display to your liking. A friend of mine was used to reading DOS screens in 16 colors, saw my TT and only said "Jeezz, I can hardly read it". So I set a fontsize 18 for him and asked "How's that?". Should I also make a version for people that want BIG fonts on their screens, just because they like it?

What I normally check is how the page would look like on a monochrome system. I wish all the suckers that use fontsize 2 in red on a black background did that. It's easy enough to check that in CAB.
>
>>I only found out this morning (!) that I could set different fonts for
>
>I got a nice thick manual with my CAB

The problem with manuals is that you read them but once you're off they lie around gathering dust...
I had my fonts set only for the standard style. Somehow some settings for bold, italic were changed too, but I had never really looked into these. So for "formatted text" I had a Verdana font at size 10, for Bold somewhere the systemfont was set and for italic Baskerville. Then for "normal text" some other settings had been set and all in all it was a

mess. Got everything set to Verdana now, looks a lot better :-)

3159. Re: MagiCMac Demo Problems

Newsgroup: comp.sys.atari.st
Date: 1998-11-20 00:00:00 UTC
From: curis@capitole.lure.u-psud.fr
Message-ID: <slrn75b2hv.tut.curis@capitole.lure.u-psud.fr>
Source record: 89615

Bonjour,

Dans son message ï¿½ï¿½MagiCMac Demo Problemsï¿½ï¿½, Neil Roughley a ï¿½critï¿½:
ï¿½ï¿½I originally posted this question to the MagiC list at onelist.com but
ï¿½ï¿½received no answer besides a reference:

This answer is not really a solution, but a try of explanation...

ï¿½ï¿½Can someone please tell me why the latest German MagiCMac demo
ï¿½ï¿½'suspends' both Photoline and Cranach Studio? The programs load but
ï¿½ï¿½aren't accessible from MagiCDesk. The other programs I've tried
ï¿½ï¿½(GrafTool, qed, CAB) work fine.
ï¿½ï¿½I've used FPUPATCH.TOS on the Photoline and Cranach executables but
ï¿½ï¿½nothing is altered, so they should run in their original state.
ï¿½ï¿½Why would MagiCMac suspend (as reported by its program manager) these
ï¿½ï¿½two programs? I've tried the ST and TT executables of each program, of
ï¿½ï¿½which run fine on a TT using MagiC 5.11.

It's ï¿½ï¿½well knownï¿½ï¿½ that running some programs on Magic Mac on Power
PC (and only on Power PC) can ï¿½ï¿½suspendï¿½ï¿½ the programm if on try to use the
Floating Point Unit, including tests to detect it, in certain ways [may be in
all ways, in fact...].

It can be corrected in _one_ case by Fpupatch : if, and only if, the
programm is wrote with Pure C and its standard starting code.
If programm is wrote with something else, Fpupatch simply doesn't make
anything (I think it doesn't recognize the programm loader).

I've had similar problems with programms wrote with Turbo C, the
ancestor of Pure C : program halts, and no correction with Fpupatch, but the
problem was the same as for Pure C programms (FPU detection), as shown a patch
of the Turbo C loader.

So may be Photoline and Cranach are not written with Pure C or with
it's standard loader, so FPUPatch can't correct the FPU detection phaseï¿½? That
will produce the same symptoms as that you describe.

Only solution : use a desassembler and patch the program to replace
the FPU detection by NOPs :-(

I'm not sure it helps a lot, but...

I was having the same problem myself - until I tried using the
Canadian Yahoo (http://www.yahoo.ca) and I got the header graphics back. Now
that's where I go when I need to access Yahoo.

You'd need a custom software driver.
Who knows? There could be one on a ftp site somewhere. Something like the
Resevoir God's driver for the Jag-pads,
a little .PRG that when you runs it lets you move the mouse
with the Jaguar controller...I'm sure a little modification of that code could
get a nice working touch-tablet driver.
I've got one too, so let me know, I always wanted to be able to use art
programs with it.
I'm not sure how the pin layout works, but I think it's similar to TWO "paddle"
controllers, each one sending a value of -255 to +255 for each dimension.
Anyway...

3167. Trust W95 kbd to Falcon DeskTopper

Newsgroup: comp.sys.atari.st
Date: 1998-11-20 00:00:00 UTC
From: Jan.De.Smedt@village.uunet.be
Message-ID: <734e3e$c82$1@xenon.inbe.net>
Source record: 89623

Hello everyone,

I connected a Trust W95 kbd to my Desktopper Falcon.

The connection is made with a print called Adaptakey,
http://wwwusers.imaginet.fr/~oxo/systems

I use the Adaptakey driver in the AUTO folder like they say, but
for the kbd to work I also have to use Pascal Fellerichos CKBD Deluxe
with the French kbd table. That way it works in TOS, Magic and N_AES.

My problem:
The Adaptakey driver dates from 1994 and so does CKBD.
It is a AZERTY kbd so I use F.KBD.
The top row keys (with the numbers) have two symbols in the lowercase
position and the keys next to "P" and "M" do not print the right keys.

- How do I get ASCII 045 "-" and ASCII 095 "_" to work properly?
They are next to the BACKSPACE but all I get is "=+" in TOS.

- What about the following characters?
[] are lowercase right next to the "P"
{} under the "9" and "0"
and \ are unreachable (lowercase right "3" and ">")

Does anyone have a correct CKBD *.KBD file so I can get to the keys?
Especially BACKSLASH is important for pathnames etc.

Greetings,
Jan

I think the Acorn Archimedes may have been the first 32-bit
machine. It was certainly claimed to be the fastest
microcomputer in world when it came out in 1987 and was
described as being 32-bit.

Then we have odd things like the Sinclair QL which came out
in 1984 with the 8/32 bit version of the 68000.

Perhaps it would be more fun to compile a list of the worst
computer events in the last 20 years. I suspect there would
be more agreement between Amiga and Atari advocates on such
a list.

The problem is for me, and possibly others, that I do not understand a lot of the instructions. If by messing around I get something to work then well and good. If I don't then I abandon it.

At the beginning of the year I tried to get STing to work but when I dialed I got an odd message (I forget what it was) and after several efforts gave up and went back to STik. Some time ago someone in the Newsgroup suggested an installation "demon." This was rejected by others but for the non-technical it would be useful.

Hi Gareth,

Yup, Nick is right - Warp 9 is software. I have read other postings disputing the speed difference between Warp9 and NVDI. Maybe it has to do with what resolution you use. I usually use mono on my Falcon, everything is a bit faster that way and most programs don't need color, like Cubase or other sequencers. I've never used NVDI, so I don't have the benefit of comparing them side by side. Warp9 costs much less than NVDI, but NVDI comes with some nifty printing features and fonts and stuff (maybe Nick could fill in some specifics) - depends on what you need. My version is 3.80, which may be the last version or close to it. Warp9 also has screen saver options, but I just have it set to turn the screen all black when it kicks in instead of one of those "silly screen" saver pictures. Thpbpbpbp!! ;-) If all you need is faster screen and mouse, I think that for the money Warp9 would be the way to go (if you can still find a later version), but if you want more goodies try NVDI or Silkmouse, etc. Nick, does NVDI come with a mouse accelerator? I don't know.

Hope that helps - good luck.

3179. CAB 2.5 & STik OVL Problem

Newsgroup: comp.sys.atari.st
Date: 1998-11-20 00:00:00 UTC
From: rwatson@zetnet.co.uk
Message-ID: <734ootnrr1@roch.zetnet.co.uk>
Source record: 89635

Hallo

I am a relative newcomer and have set up my system with the software pack from Zetnet and I have the following problem.

I have a 4meg STE with Veloce 2meg running Magic 5.11 and NVDI 4.11. I use STik and CAB 2.5 and I can only get CAB running with the OVL (file size 46041 bytes, dated 01-12-96) supplied with CAB 1.5. When I try and access any of the Cyberstrider sites I get the page saying I am using an old browser. Denesh suggested I try the later versions of CAB_OVL.

However I have tried the OVL supplied by zetnet and ver 1.2904 downloaded (both 33693 bytes) from Anthill Industries but when I use these I get the 'Network is down Error 312' message and the file is not found althought the modem is still connected. I have tried running the system without Veloce, but the problem still persists. I don't seem to have any problems with Newsie.

I have spoken to Schuiming at Systems Solutions but he does not know why this is happening.

Thank you to Trevor Spencer and Robert Goldsmith from the Zetnet Atarians List for responding to my cry for help there. I have tried reloading and using the OVL that came with 2.5, and the latest Beta from Anthill and altering the config file, all without success and I am not using a proxy. The only OVL that works is the one with CAB 1.5.

What next? is it a problem in the Auto folder? should I go onto STing? Should I try the 2.7 demo? Any suggestions gratefully received.

Richard W

many thanks

Richard Watson

Hey Uwe,

Thanks for the great software..... Will upgrade mine when 7.6
comes out in the english version.

Hi Sheldon,

Can you tell me how if as you said in your post" Its possible
the files have an illegal filename that the system can't
recognize" how could you rename it if the system can't recognize
the filename in the first place?

Hello Stacy-owners,
I have many Atari-computers, but I'm very fond of my Stacy4/50MB.
Still it seems the Stacy has its own different structure and sometimes....problems!
So I would like to start an emailservice for all Stacy-fanatics.Let's exchange our experience, we can perhaps learn from each other. I would like to upgrade TOS, diskdrive etc.
So when you are interested in news, facts, specs and gossip around the rather obscure Stacy , give me an email.It's also open for STBOOK and.....STPAD -lovers.....
Emailaddress : <jovlie@xs4all.nl>

>to be anything about it in the HYP file.
>

Well, for a start you have to check the box in Dialer's Config/Misc
to tell it to run the login.bat after logging in.

Then you just edit the login.bat file to contain the 'command lines'
to run the sequence of progs.

If you want these progs. to run in parallel then have a look at Gary
Priest's SPAWNER. You would run this from login.bat and it would spawn
the progs you wanted to run (either serially or in parallel).

The Falcon used to run my BBS (Toad Hall, 11 years strong!) has seemed to bite the dust. Got home earlier today and clock radio was flashing, like it lost power. However, nothing happened to the VCR which leads me to believe I didn't lose power but there may have been a electrical "blip". I checked the BBS to make sure it was still up, and saw nothing. Went to re-boot and realized the Falcon wasn't powered up. Weird. Checked, it was turned on (as it always is). No power. Power supply?

There is certainly a full demo there, but the last ime I looked it was
only in German. Probably still usable, but without an English RSC and
HYP file one wouldn't discover some of the features, I think. Or is
there an English version there now?

It would be interesting to know what porgrams you are using with Geneva,
and what you tried to use with Magic. And how much RAM you have.

If it crashes a lot when you've tried it, that seems to be a matter of
the programs you've used. I have no significant problems in over a
year's use, and I'm using MagicMac rather than plain Magic. I can't
argue with your experience, but loads of people have had no such
trouble.

Hi Chas,

So are you saying your former problems have been iron out and you're up and running to your satisfaction? I ask because I've also been having random problems with my server and am considering moving to another server. Also seems reluctant to set me up an additional trial account so I can attempt to get Sting going. Are you now in a position to recommend your current server using a PPP setup? Thanks in advance for any info.

Your old pal,

Jim

Sometimes, depending on the O.S., you can handle the file by referring
to its name in quotes.

I ran across that once when I FTPed some files from a system that
allowed the SPACE character as a legal filename.

The Tweety kit was a "push on" upgrade. It mounted simply by pushing
it down over the existing Yamaha soundchip. There was a bit of
double-sided tape on the underside of the Tweety that adhered to
the top of the soundchip to keep it in place. Then the extra RCA
jacks were extended to the outside of the case and that was that.

Thanks for the suggestion. My girlfriend was trying for a new job at a
college, and since she doesn't have a computer at home, I loaned her my spare
STE (I use a Falcon) so she could practice with a few typing programs. I just
figured the more the better.

I myself am of the advanced "hunt and peck" method. 8^)

I�m using MagicMac 2.1.5 with MagicDesk on a Power Mac G3. I have enabled long filenames in the drives parameters, and can see files with long names on my Mac hard drive from with MagicMac. But the file selector in MagicDesk won�t show files or folders with long filenames (or even open folder with short names which contain files with long names).

```
Is this a configuration thing, or do I need to use another file selector,
like Freedom or Box Kite?

> I'm not sure it helps a lot, but...

I was already familiar with FPUPATCH.TOS, but not in the detail outlined by you, Emmanuel... thanks.

It seems my problems with the MagiCMac demo are related to its 4MB memory limit. Still, the ST version of Photoline 2.25 _should_ run with that amount of RAM. I'm not entirely convinced yet that it's a memory 'thing'.

When you say Photoline runs great, do you mean under the MagiCMac demo?
This is important for me to know because I can't get Photoline 2.25 to
work with the demo -- it gets 'suspended'. And I've found that
FPUPATCH.TOS has no affect on Photoline's ST executable (the log reports
nothing was altered). I'm trying to figure out if the reason for
Photoline not running correctly is related to the MagiCMac demo's 4MB
memory limit, or if I'm doing something wrong.

3218. re non deletable files

Newsgroup: comp.sys.atari.st
Date: 1998-11-21 00:00:00 UTC
From: binson@zetnet.co.uk
Message-ID: <736b7o$3i$1@irk.zetnet.co.uk>
Source record: 89572

SORTED
But only by re partitioning the internal drive on the falcon

I had ST TOOLS and could edit the illegal name, which had a 4
digit extension as against the allowable 3 digit.
But after editing it still could not be trashed, by editing
the first letter of the file name to the symbol representing
Atari's delete file, I was able to trash it from ST TOOLS.

But after doing this hundreds of files on the same drive
became corrupt and could then only take the above action.
Back up and running now and everything normal. Thanks again
to all who contributed to the problem.

Almost certainly.

Check any mains fuse. Then check the fuse in the Falcon's PSU. I bet
you will find one of these has gone.

Blips are always bad as the machine will re-start from an undefined
'half powered-down' state which can lead to big loads on the PSU.

Source record: 89575

Hi there

I have two original copies of NVDI4

One is the Atari version, the other the MagiCPC version

I'll be upgrading to NVDI 5 and the dilemma I have is that I am
unsure which one to upgrade with (as the current version is an
all-in-one-for-all-platforms version).

nvdi 5 full version is 60 quid
nvdi 5 upgrade from 4 is 30 quid

Anyone prepared to give me 15 quid for NVDI 4 (either MagiCPC version
or Atari version)? Plus postage of course.

You will then be able to get NVDI 5 for an extra 30 quid. :)

Please get back to me within a day or so as I'll just pick either of
the packages blindly and send it off for upgrade. I'll be upgrading
at the weekend.

Regards
Danny

Hej Hallvard,

Well, I agree completely... And not only all the stupid graphics that eat only time, but in most cases don't mix with the rest of the page at all. My main complaint is about text hardly being readable. Either fonts too small or color on the background color is completely wrong. Some people appearently don't understand that you need contrast for reading: black on white, white on black, light colors on dark colors, but even yellow on darkbrown is not good enough. I don't like white backgrounds, but I deliberately chose for a light yellow (beige?) background on my pages.

>Having experienced all of this I have to brag a little about my own work
>-I admit that my pages aren't much to look at, but that's deliberate.
>My main page contains icons for each category (URL in signature) so that

>
I just went to visit them and they are very much to my own liking... Simple, neat, conveniently arranged. And because of that, looking a lot better than the usual crap. BTW, I like the remarks on non-Windows, non-Intel stuff... I have one not so well readable line on my own page "This page is best viewed by NOT using Internet Explorer!"...

3232. Xmas 98 Shareware fees discount via CyberSTrider

Newsgroup: comp.sys.atari.st
Date: 1998-11-21 00:00:00 UTC
From: denesh@cyberstrider.org
Message-ID: <3656f95e.37772453@news.demon.co.uk>
Source record: 89586

Hi guys and gals

I am currently working on a special Xmas 98 price list for shareware
via CyberSTrider. I am hoping to have the full list ready for next
week for all to use.

Fees are discounted up to 62%!

In the meantime, I will send individuals the latest draft order form
to order with, if they wish to order any thing at the cheaper price.

So far, the prices are:

Software Discount (%) Price (UKP)
Speed of Light 20 16.00
Bitmap View 4 30 10.00
Kivi 30 10.00
iPRN for TOS 15.5 11.00
iPRN for MagiC 15.5 11.00
Selectric 61.5 5.00
Easy_PGP Shell 61.5 5.00
MBE 16.5 5.00
JAY MSA 20 8.00
Zebuland 14.5 6.00
TriYahoo 20 10.00
New Design 20 8.00
JAY Bonus Disk 20 4.00
Running (Falc) 25 15.00

Remember, if you wish to pay in USD, then multiply the above prices
with 1.6 - thus fees x 1.6 = USD fees

Regards
Danny

Atari 520STfm w/ internal disk drive for sale. Like new condition with manuals and original box. $25.00 + shipping and cod or $30.00 total shipping included if prepay.

Thanks, Mike

3234. Running Dungeon Master on Falcon

Newsgroup: comp.sys.atari.st
Date: 1998-11-21 00:00:00 UTC
From: staylor640@aol.com
Message-ID: <19981121134755.09762.00001240@ng40.aol.com>
Source record: 89588

First, thanks to those who responded to my previous post a few months ago. I bought a NEC Multisync 3D and it works great with my Falcon.

I am trying to get Dungeon Master to load. According to the games compatibility list I read, it should work. I tried cold-booting the Falcon with the disk in drive A. The game will load this way, but the computer is in the wrong video mode, so I end up with two side-by-side displays of the screen with only four colors or so.

I tried using Backward II as well. If I tell it to reboot, with the disk in the drive, it will load the FTL splash screen, then stop loading after about 10 seconds. If I hold down the ALT key, per the instructions, then select START.PRG from the minidesk screen, it bombs (2 or 3) after a few seconds.

I am using a Falcon030 with 14 megs of RAM. It is an original Dungeon Master diskette.

Any ideas on what else I could try?

TIA,

Steve

As long as your ST has TOS1.04 or later, it should work just fine. The
problem with earlier versions of TOS is that they can only support 16mb
partitions, which makes large capacity hard drives impractical.

I'm the guy who needs the tn3270 terminal.

I need this to access the back office of my firm. I can go get an old
486 to do this for $150 USD, but I was hoping that I could use my STe
sitting in the closet for this. I have Sting and cab and all that
stuff, and I have several telnet clients, but i need specifically a
TN3270 protocol because it does whole screen updates and not line by
line on a reg vt102 screen.

Thanks

B.P.

3245. Falcon with Nemesis and Magnum FastRAM card

Newsgroup: comp.sys.atari.st
Date: 1998-11-22 00:00:00 UTC
From: it061@my-dejanews.com
Message-ID: <738fqj$8v8$1@nnrp1.dejanews.com>
Source record: 89501

I have a 4Mb Falcon 030 with a Nemesis accelerator, and I am looking at adding a Magnum FastRAM card to it, so that I can have 8Mb of FastRAM as well as the original 4Mb.

I therefore have two questions, does anyone know anything about this card, and, perhaps more importantly, has anyone used it with a Nemesis accelerator, or any other system accelerator.

Any information about this card, or others like it would be much appreciated. Also any ideas about whether the Nemesis and the Magnum card will be compatible would be much appreciated.

Thanks in advance...

Are you a member of the former Atari 'scene'? Did you, perchance,
visit the "ST News International Christmas Coding Convention", in Oss,
Netherlands, December 1990?

Then you should not wait a second longer and surf over to
http://www.scriba.org/stniccc2000 to discover that, in fact, a reunion
of that very historical event is being organised for December 2000, a
10th anniversary reunion as it were! It is going to be the coolest
event on the other side of the millenium change, I can assure you!

I had the same problem. But then tried out a simple terminal program
(like UniTerm or Rufus).
Because I know my name and password I could login in the old
fashioned way with my provider.
So I found out what STiNg was supposed to do initially.
And after that I only had to ask them by voice for names of
servers etc.

Met vriendelijke groet,

Yes that URL is closed. Jo hasn't an Internet connection anymore. The
pages are on:

http://www.geocities.com/Tokyo/Temple/9537/INDEX.HTM

It's quite possible I'll take over the pages. I'm waiting on the fiat of
Jo to take over his work.

This is one of an older generation drive that needs a double boot, there's
nothing wrong with it, There are auto folder prg's around that will, once put
in your boot floppies AUTO folder, repeatedly reboot the machine until the
HD-drive is ready.

There's probably something wrong with your FREEDOM.CNF file, causing the
string to be formatted wrong for the circumstances.

My freedom and V-FAT combination work fine, would you like to try a copy of
my FREEDOM.CNF file?.

Hi

Can anyone remember the name of the firm that had two boxes of hard Drives
for sale, they were pitched behind the buy and sell stand.

If anyone does, can they please let me know, as I want to try and get my
money back.

As they sold me 3 hard drives (used) and not one of them worked, one in fact
started to smoke when I turned on the power, the other two just won't spin:-(

From: PATNANNA@ford-trucks.com
Message-ID: <3657cfa6bd3d2f0@ford-trucks.com>
Source record: 89528

NVDI 5 is nice and I have no real complaints after updating, but...

One of the nice things about NVDI in the past has been the ability to Edit/Create printer drivers. This feature appears to be gone from NVDI 5, unless I have missed something.

Is there a way to edit the printer drivers in NVDI 5? The program supports my printer *BUT* doesn't allow me to select the auxilliary paper feed and this is a nuisance.

Thanks,

Pat

Maybe my reply didn't get through, maybe your on line ok now, or maybe
your off line.

I connected with the above number and didn't get a hangup from STiNG.
I contacted Lancaster Internet Services and they said they would setup
me up a trial account to work on your problem. But no reply from you
indicates that your ok now. Maybe you could follow up on this help
offer?

I think one Magnum user said that he cannot run over 40Mhz with the
card. That would be keeping in step with the Mighty Sonic, Afterburner
and FX.

Hy Danny,

Well, can I take over the name MAG please? Cool name, and I can't
think of any more (oh well).

Again, any atari users in Manchester want to be part of a group,
please get in touch!
Young and old, newbies or experienced. Everyone welcome!

OK, I've been putting together tunes on me electric organ for a couple of years and I am the bemused owner of a 1992 vintage Atari Falcon. To be honest I'm seriously considering buying a new PC soon but in the meantime I'd like a v.cheap/free MIDI sequencer with piano-roll editing and flexible pattern structuring (i.e. not a tracker - PLEASE!). Can ANYBODY suggest a suitable program? I'm not prepared to pay any more than 30 quid. Searches so far have been fruitless. I've tried Henry Cosh, Sweet 16 (but the Piano Roll version costs money and quite frankly is a bit crap), Sequencer One (worse) and Trackman (crap again). Please help now or lose me to PC-dom forever!

IMO Sweet 16 is about the best sequencing package for the amount you want to spend. Cubase 3 has a really nice piano-roll editor.

You got a Falcon dude. It's made for MIDI. Plus you have analog I/O. Cubase Audio Falcon is awesome. You should really reconsider this before jumping to Windows.

If you'd like a taste of what PC users are going through, visit the newsgroup alt.steinberg.cubase

Atari Cubase users spend time making music. We don't have to deal with ASIO drivers, Direct-X 6, page faults, crashing, crashing crashing. Get my drift?

Good luck

Steve C

> text size.

Some of the colour thing is to do with how many colours the author's screen
uses. There are lots of colour combinations that look OK with 65,000
colours or more that are totally unreadable with 16 or 256 colours due to
dithering. Still doesn't excuse the poor design, though. You'd think they
would check how the page looks in fewer colours. I guess it's the same
mentality that assumes that the user is going to have a minimum 800 x 600
display, so with the usual horrid combination of frames and tables the page
is completely unusable at lower resolutions.

<snip>

> I guess some of those pages are made with a background picture in mind,
> but what about thos of us to choose NOT to download images?
> Most of the time, using some plain old common sense can turn a web page
> into something useful.

Indeed. No point in using bells and whistles to the point that they prevent
people from using the content. OTOH it's possible, with a little thought,
to use newer HTML constructs (eg frames) sensibly and in such a way that
the pages degrade gracefully (ie remain useful and usable) for people whose

browsers don't support those features, without necessarily having to resort to a second set of feature-free pages. The most obvious things are using a sensible NOFRAMES entry for a frameset page (rather than some stupid message telling users to upgrade their browser) and using ALT tags for images, as you mention. There are other useful techniques that will aid users of text browsers etc, especially visually impaired people using screen readers etc. Check out links from the Bobby validator at:

http://www.cast.org/bobby/

Hi all,

just back from a visit to the Dutch HCC fair over here...

I figure I bought my RAM upgrade just in time: the Aixit board arrived early this week and today I've been looking for the SIMMS.
First, prices are going up again, and they're rising fast!
Second, SIMMS are said to be no longer produced so they are already becoming scarse. Most dealers had SIMMS for 16 Mb or even less. 32 was hard to find and pricey already (add 30% to the prices of 2 weeks ago). I was lucky to find one firm that had left 2 pieces of 64 Mb EDO, one was asymmetrical type so not fit for the Aixit board, the other one was the right type and at 100 USD I figured also a readonable price. Just replaced the old Atari 16 Mb board by the new Aixit board with 64 Megs, the memorytest went OK: 65536 kb of memory in the TT section.

Haven't run benchtests yet, I'll do that later this week, but I imagine the set runs slightly faster... Anyway, I've got plenty of RAM to play around with now.

The second item I bought was a 1 Gig IBM SCSI-2 drive for 70 USD. Type 0663 (?). Anyone has jumper settings for the ID for this drive?

Pity enough nothing Atari on this fair, and only one stand with the iMac. Even Linux was only represented at one stand only...!

3289. Split E-mails

Newsgroup: comp.sys.atari.st
Date: 1998-11-23 00:00:00 UTC
From: paul.williamson@zetnet.co.uk
Message-ID: <73a9heakm1@roch.zetnet.co.uk>
Source record: 89446

Hi all,

Several of us Zetnet users in the U.K. have been getting some split E-mails. Typically we get a few of them, then the problem clears for a while. They occur regardless of whether the sender or receiver is using an Atari or a P.C. and several different E-mailing programmes have been used.

They also arrive either on mailing lists or as private mails, and I have had them from the States as well as in the U.K.

I have been in touch with the technical staff at Zetnet, and I would like to be able to tell them whether or not this only happens to Zetnet customers, or whether other ISP's are involved.

The mails appear to have an "end of message" full stop added somewhere in the system so that they arrive in 2 parts. The second part, curiously, seems to arrive safely without any headers or address etc. It is always marked "No Subject".

Can anyone shed any light on why this may be happening, and has it happened to anyone else ?

Mail relies direct if you prefer.

Thanks

Paul

Yeah - don't see why not - just as long as you mention that is nothing
to do with the 'original' MAG and that you are using the name as the
initial group no longer exists.

Maybe you want to take this further and also use, MAG Mag as the title
for your newsletters. We did. :)

Take a look in one of the mags from around 94/95 and see us mentioned
in it. ;)

Body handling: HTML body converted to readable text

I was looking on the net about html tags and I indeed found this:

HTML 3.2 Table Model. There are the hspace and vspace attributes
to the
table element that define the horizontal and vertical space (in
pixels)
between a table and the surrounding text. <>

If this above statement is true and CAB is HTML 3.2 complient
than this statement

should work as it does in IE, Netscape and Opera. If this is not
the proper way to do this can you please show me the correct way
to display a image as a background in a table column.

Thanks David

Usually they always have the newest version in stock. This is because
System Solutions gets each new version immediately, i. e. there is no
delay between the release in Germany and in England. Note that you only
get this service with System Solutions and with no other English
distributor.

I gues we should add FAT32 partitions as they are supported with
FreeMiNT 1.15. The maximum partition size for these partitions is
several TeraBytes. i. e. much more than 1024 GBytes.

That's wrong. Even the oldest TOS supports partitions up to 256 MByte.
These can also be boot partitions. The advantage of TOS 1.04 is that
it's much faster with large partitions than older versions.

I've probably blown my Modem-2 port after fitting the card. Stupid handling! TT was switched on, tried to connect, no go, forgot the modem plug and plugged it straight in... After that: no more can do :-(
So I'm back on Modem-1...

Hi,

Thanks for the advice, what should be the compatibility between Link2 and Link97, I mean, if I have formatted a hard drive using the Link2 interface and the ICD tools, may I be able to unplugged the ICD interface, plug the Link97 interface and start everything ??.

Cross-posted to: comp.sys.atari.advocacy,comp.sys.atari.st,rec.games.video.atari

Back In Time, a web site dedicated to all Atari games and computers, has recently expanded, and moved to a new web host at http://www.emuclassics.com/backintime.

The site has information on all Atari game consoles including the 2600, 5200, 7800, Lynx, Jaguar, Pong, etc. Atari computers are covered extensively. Those systems include the 400/800, XL, XE, ST, TT, and Falcon series. Other Atari devices, such as the Hotz Box, are covered. Up to date news on the Atari scene is included. Emulation of these systems on the PC platform, along with arcade emulators, is included. The site also looks at some prototype and vaporware equipment.

The site is full of history and photos. Good Atari web sites are vanishing from the web. It is my intention to make my site a leader in Atari coverage. If you love Atari, you will have to check out Back In Time

Where do you need a file selector in Magxdesk?

Exactly: The process must run within the MiNT domain (->Pdomain()).
At least newer versions of Magxdesk call Pdomain().

3311. MagiC 6 Icon colours

Newsgroup: comp.sys.atari.st
Date: 1998-11-23 00:00:00 UTC
From: roger.carr@zetnet.co.uk
Message-ID: <73c2qv$c0t$1@irk.zetnet.co.uk>
Source record: 89468

I saw MagiC 6 running at ACC'98 and was impressed with the new desktop with its buff/manilla folder icons and the swish CAB program icon, for example. I've installed my copy but the palette is all wrong: The folder icons are khaki/green and appear to have been knitted from bogweed; also, for example, the CAB.APP icon is blue on red, closely resembling a standard test for colour blindness.

I've tried disabling various AUTO and START applications, and I've tried different Desktop background colours using both the MAGXDESK 'Preference' menu and the new (undocumented) 'MAGICCFG.APP' which came with the MagiC 6 package. Makes no difference.

I'm running a Nemesised Falcon @ 640x480x256.

Has anybody any ideas what's happening, please?

Roger Carr

3312. Re: Decent Atari sequencer CHEAP

Newsgroup: comp.sys.atari.st
Date: 1998-11-23 00:00:00 UTC
From: Kyle Farrell <kaf@cdac.com.blah.blah.blah>
Message-ID: <73cb9q$b00$1@brokaw.wa.com>
Source record: 89469

I've been playing with Cubase VST 3.553 on Windows 98 for awhile. I'm suprised at how poor the interface is compared to CAF 2.06. Just simple things like animating the scroll bar when you move it, or being able to choose whether right clicking increases or decreases values. These options are present on CAF, but I haven't found equivalents on the PC version.

Seems like the best combo would be to run Cubase on the Atari with an audio sequencer like Acid on the PC. Now if Sonic Foundry came out with a midi sequencer it might be a different story...

Just be careful moving parts around too much in that arrange window on the Atari. That seems to crash Cubase a lot.

Hello,

I would like to network a TT and a PowerPC.

(1) How can this be best accomplished?

(2)What do I require in additonal software and hardware?

(3) What level of technical expertise to I require to set this up?

I have MagicMac if that can suggest other possibilities.

Thanks for the help

On last thrusday night the connection went totaly dead for me,
and ever since then I could NOT get online at all, so no way
other than my part time BBS could I be reached. So today I
started calling the other ISP's and now I'm on a free two week
try on another one. The tech at LIS (now network one) just told
me on thursday afternoon that the company that they got their new
boxs from had looked at the debug log from them and said it was
my softwares fault and would not do anything. So much for their
Easy Access.

Yes. The host adapter should be transparent. You will only get probs.
if you use a driver which does not understand the ICD partitioning
scheme.

I've just bought a working STFM at a car boot sale (for UKP 4.00 :-)). It came with a 28x28x19 mm black box connected to the joystick port via an extender lead.

Does anyone have any idea what this box does ? It has two blue dots on the top and is sealed with some sort of resin so it can't easily be opened.

Same here, I didn't "study HTML", didn't read books on it but looked at
the samples that came with CAB, looked a lot at source codes from existing
pages and right now I get the main picture.

>And lastly I try to check now and then (at least after some major
>updates) that my pages are indeed HTML compliant, using a web-checker

Well, don't do that here, but as long as CAB doesn't show me the green
smiley, I think it's OK. Furthermore I've got some friends running I.E.
and they didn't complain either...
What I do check at least is how the page looks like in monochrome.

>Fortunately for us, this means cheaper harddisks and memory ;-)
>
Well, let's not start another discussion on this Win-thing. Haven't got my 1 gig IBM drive going: it's a 1991 model, SCSI-2 and it came with 2 jumpers set on 2 positions of the 8 in total. As they were set, the drive spins up perfectly but both my TT and my ST refuse to boot with it hooked into the system. Note that the ST "boots" with a desktop without any icons..., the TT simply won't do a thing at all. When I remove one jumper that remains the same (probably the ID jumper) but when I remove the other one the drive no longer spins up and my system boots, but won't see the drive. Gotta experiment with those jumpers some more. The idea was to gonna use this drive for either NetBSD, Linux or something like that. For the time being I can use a little extra storage room too...

The cheaper hardware remains to be seen: surely prices went down, OTOH with all the changing "standards" (PCI becoming extinct, now SIMMS becoming extinct) the prices go either back up or the items simply are no longer available. With my future plans of buying a 68060 Hades, Milan or whatever, there's a risk that the nice'n cheap PCI hardware will be no longer available but secondhand. Does "our" new hardware accomodate DIMMS, AGP boards or USB-ware?

In think the truth is far less interesting. The first 32 bit PC with i386
(Compaq) was 85 or 86.

3328. Atari STuff For Sale (US)

Newsgroup: comp.sys.atari.st
Date: 1998-11-23 00:00:00 UTC
From: Don Schoengarth <dons@qnet.com>
Message-ID: <365A2AC1.49DF82ED@qnet.com>
Source record: 89485

Hello everyone once again Im still trying to clear out my computer
room and garage. I have the following for sale. BUYER PAYS SHIPPING..
I just need to get rid of the stuff I have left so I can have some room.

520ST $10
520STFM $20
1040STF $25
SC1224 $35ea I have 2 of them both JVC
SM124 $15
SM125 $15 220 volts
Atari mice $7ea
520ST MB $5
SF354 $5ea I have 4 of them with power supply
SF314 $10
SH204 case and adapters no hard drive. $10

And I bunch of software. NO music software lots of games and
applications. If you are looking for something special please ask I may
have it. Do not try to haggle with me on the shipping...

Thanks

Don

> resembling a standard test for colour blindness.
> [...]
> Has anybody any ideas what's happening, please?

This is with >= 256 colors, right? Then it's quite likely that these new
icons were created using NVDI 5's palette, which is said to better for
dithering. If you have any program which installs a color map, you
should get nice-looking icons when using the correct one (IIRC, NVDI 5
uses the same palette also found in the Jinnee demo archive). Best bet
of course is to install NVDI 5 ...

If you already have NVDI 5, check for any older CPX modules which might
also install their color map.

Of course, it's also possible that you _are_ running NVDI 5, and the
icons were created with the standard VDI palette for 256 colors, not the
one used by NVDI 5 ...

In case you're working with only 16 colors, I don't know what causes
your problems.

Ciao

Thomas

There shouldn't be any problem formatting a drive with the Link97. I
owned a link97 and I always used the ICD tools (6.5.5). As long as you
load the ICD boot program, then the formatter.

The Link97 is basically the same as the Link2, but is not official and
comes from Germany.

Newsgroup: comp.sys.atari.st
Date: 1998-11-24 00:00:00 UTC
From: NOSPAMwplatt@bellsouth.net
Message-ID: <3Oy62.2456$Gy.2534982@news4.mia>
Source record: 89402

Hi Dennis,

Find an ISP that supports PPP and PAP as well as assigning dynamic dns and dynamic IP addresses. Bellsouth.net has this. The only thing I need in my configuration files besides the TTL and techie stuff is my user name and password. I deleted out the IP address and the DNS and hostname. The only thing in my dial,scr is the phone number, user name and password.

When I first tried to get connected to bellsouth, I had fits trying to get STing configured. Then I came up with the idea, give the script as little info as possible qand add more as needed. The result, name, number and password are all that's needed.

If you get the Magnum working (the card was developed and optimized for the normal 16MHz bus timing, so I can't guarantee that it works with a faster bus), you will get a much faster RAM access - more than factor 2 faster than ST RAM in highcolour, and still a lot in 256 colours.

AFAIK, no new Magnum/F030 are produced due to a lack of the correct SIMM sockets - there is not enough demand to order a new batch.

But the nice thing about HTML is that you can illustrate the contents
in many ways.

And DESIGN is all-important now.

People do not read contents anymore.
You get their attention with DESIGN.
And from the viewpoint of the DESIGNER: simple design-out the
contents because the contents is too dull. And nobody complains.

Hallvard, I think not. I visited the site during the weekend and that's
usually a busy period. Page came in quite fast. Well, of course the icons
take D/L time, but not that I thought "My Gawd, this takes a longtime!".

I'll see what I can do. I fiddled around some more with the jumbers
without any result. Either the drive spins up and my systems won't boot or
the drive doesn't spin up and I can boot, but it's useless then.

Well, I'm on a 2 week free time to try Qnet out and so far it's
not to bad, I got on real fast and got my mail started after I
remembered to change it in newsie 88 and change it from ptw to
qnet in the mail and news server parts.

I was also able to D/L the whole newsgroup list too, something I
was never able to do on ptw. Only thing I see now is that when
mailing out e-mail, newsie or is it sting? seems to wait for 30
secs and then dump it all out. I saw something about this before,
but have forgotten what was said.

But I'm not doing to bad with this Atari 2600 running via a
T/S-1000 64k CP/M via 56kb modem. ;}

The thing I haven't yet been able to figure out about NDVI 5 is whether or not it will be useful for me. Take the HP Drivers, for instance. It comes with "670" and "690" drivers. Will these run a 672? a 695? a 722? What about the Epson 600 driver now that they sell the 640?

Also, how is NDVI with Geneva? Version 4.12 is a dream, but I've heard conflicting reports.

Info on this would be very much appreciated.

Well, yes and no. TOS 1.0 (and I think 1.2) had a limit of 16 Mb as GEM partitions. Larger than that required BGM (Big GeM). TOS 1.4 (and maybe 1.2) boosted the GEM limit to 32 Mb, a limit that I still hold to on several partitions in order to run LittleNet and several other very old programs. Hopefully I'll be able to get STing's MidiNet running in the near future to be able to get away from that.

One other little note for the curious -- I'd be wary about using partitions greater than 256 MB with older troubleshooting software like Diamond Edge. Some have reported troubles.

3346. NVDI 4 Install Problems...

Newsgroup: comp.sys.atari.st
Date: 1998-11-24 00:00:00 UTC
From: jaubrey@jaubrey.demon.co.uk
Message-ID: <911946742_OASIS_@jaubrey.demon.co.uk>
Source record: 89412
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.programmer

I have recently brought a copy on NVDI 4, I ran the install programme with the pointers goint to D:\, I rebooted the computer on completion, and noticed in superboot that a new NVDI auto prg had been highlighted(I had previous NVDI 2.5, disabled) and also a 'Wdailog' as well. I selected the correct(newly updated) Assign.sys file and escaped to desktop. All the usual blub scrolled up, including the NVDI4/Wdailog install bit. Then instead of being greeted with desktop, all I get is a blank screen, apart from ledpanal on top right corner, nothing seems to happen, only option reboot again. I disable all the new offending proggies from boot prg, and return to desktop to notice that they've been somehow enabled again, same happens as before. I found a way around this, pressed F3(autoload Cixcomm), exited to desktop, weird font and folder icons(in text mode). I have now deleted the complete installation. Anyone can offer any ideas as to why this won't work(yes I've RTFM), I have a STe(4mb) Tos2.06, 234mb HD, no bells and whistles added to my system...

James

Many thanks to those who responded to my earlier plea for help. I have now got CAB 2.7 demo (suggested by Denesh and Trevor Spencer) working with CAB_OVL ver 1.3011 beta (suggested by William Platt) I have also downloaded STinG which I shall give a try when I have time. For some reason it seems very stable if I have connected and used NEWSIE first, otherwise it seems less stable. This may, of course, be due to the clumsy way I blunder around the Internet!

I have tried reloading CAB 2.5 and altering the config file and different OVL's but this still will not work. Perhaps STinG is the answer to this. Hopefully 2.7 will be available soon.

It seems from all the comments that it may just be one of those quirks that affects my set up for no apparent reason, but as a newcomer to the net, I am already convinced of it's usefullness.

Many thanks - bye for now

Richard

>
> But the nice thing about HTML is that you can illustrate the contents
> in many ways.

True: but surely this should enhance the content rather than obscuring it.

> And DESIGN is all-important now.

Not if you're trying to find information about something.

> People do not read contents anymore.

Depends on the people. Recreational browsers who are just surfing around
will probably enjoy the instant gratification of skimming the surface of a
pretty site. Someone who actually wants information for a purpose will
probably curse the long download times for all those pointless graphics (or
turn the graphics off), java etc etc, only to find a complete absence of
content. Do they revisit these sites again? I don't think so...

> You get their attention with DESIGN.

You *keep* it with content.

> And from the viewpoint of the DESIGNER: simple design-out the
> contents because the contents is too dull. And nobody complains.

Poor designer. Though if that's the brief then it's what they have to do.
As for nobody complaining, I am for one! I work in a University library and
we spend a lot of time hunting out good quality information sources on the
net for our users. This gets harder due to the amount of pointless dross
out there.

That said, our library web pages aren't entirely sane, either, due to some
bad colour choices and the use of some gratuitous (and pointless)
Javascript. I hasten to add I've been trying to convince those responsible
to change them, so far with no success, unfortunately.

I don't know.

The *bad* thing about NVDI 5 is that it appears that printer drivers can't
be changed. So if a printer is not supported or a driver doesn't work as
desired, you're out of luck. As far as I can see, there is no equivalent
to the MAKEPRN function available in NVDI 4.

Oh, now come on. Ask any business who's running on old UNIX systems, and
they will tell you that EVERYTHING ends on Dec 31, 1999! ;)

Of course, you are really correct, but I think all of the adherents to that
truth have already given up on convincing the populace.. People always
like to see the 9's flip to 0's.. Which, I think, is probably the cause of
many road accidents..

>Hmmmm.... but there's always the possibility to buy things used. Things
>other consider rubbish may be worth a lot to us!
>
Hallvard, I was thinking with all those PC-boys using DIMMS nowadays, that
SIMMS could only go down in price... I checked around 20 stands on this
fair sunday, and 17 offered SIMMS but to a max of 16 Mb (several could
only deliver 8 and 1 only 4...). "Sorry Sir, no 32 Mb available!". There
were 3 stands that could help me with 32 Mb types. Prices? Ranging from
USD 65 to 100. I finally discovered one stand that actually had left 2
pieces of 64 Mb types. I called SimmCity over here (the biggest Simm/Dimm
dealer in Holland) last friday and they said prices were going up like
hell. The guy also told me that EDO is faster than FPM, but you only see
the difference using measuring gear. Using it in a computer means "the
same speed". Well, this 64 Mb EDO I've got sitting in my TT now, does
indeed speed up things a bit. You've probably seen the benchtest results I
put up earlier.

But I figure that all this PCI stuff might go skyhigh as well, becoming
scarse or only becoming available 2nd hand.

Right, I'm gonna fiddle around with those IBM-jumpers again,

That's no problem. Host adapters have nothing to do with compatibility
on the partitioning level. And formatting of hard disk is completely
platform independant anyway.

ICI2AHDI solves this problem which is only relevant if you have more
than 4 partitions on your drive and and didn't care for AHDI compatible
partitioning when using the ICD software to partition the drive.

Looking at the plan of the stands, the two immediately in front
of the bring and buy were M2 & 4.

M2 - AJP Communications - Tel. 01302 817102
M4 - Girls Venture Corp _ Tel. 01785 822026

More likely to be M2 I would think.

Hope this helps.

3370. Continuing problems with IBM drive

Newsgroup: comp.sys.atari.st
Date: 1998-11-25 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <365c3ba03a1c20@holleman.demon.nl>
Source record: 89301

Hi,

well, after some tip in Comp.sys.ibm.pc.hardware.storage I was directed to
a site specially for this type 0663 drive.
It is SCSI-2, I got the jumper info, I built the drive into my tower
because the unit where I put it first had a wacky PSU (yes, another Atari
PSU from the shoebox type!), so now the drive sits there, spins up (with a
jumper on the right psn) and when I boot Hushi says "IBM 0663 on SCSI-3".
Fine.
Next, I call SCSI-tools and want to format this drive. Well, it doesn't
appear in the list at all...???

So I tried ICD-Pro: run the ID-check and it says "SCSI-3 IBM 0663 drive",
next I start ICDFormat and there is no option for *this* drive to format.
All I get are my 2 Trailblazers and the Syquest drive.

How come the ID tests see the drive, then when I wanna format it they
don't?

Don't start about termination, the IBM has no termination at all, it sits
in the middle of my chain with the Pioneer CD-ROM physically at the end
and that one is terminated. Shouldn't be a problem, then.

Anyone with a clue is welcome again.

>
Well, I guess it's not formatted. Anyhow, I want to partition it at least into one 200 Mb start partition and 2 400 Meg partitions for Linux or NetBSD. But there's no partition option either!

I don't get this: Hushi displays all devices at boot time: so it says there's one Quantum at ID 0 with partitions C, D, E, F, the Syquest at ID 1 with partition G, another Quantum at ID 2 with partitions H, I, J, K, then the IBM 0663 at ID-3 without any partition info, next the CD-ROM at ID-4.
So the drive is seen.
Starting SCSI-tools doesn't list the drive on ID-3 at all, so not in the format/partition list to select.
ICD-Pro lists the drive as well in the ID-check program: ID-3 with IBM 0663 drive. Going to ICD-Format won't list the drive again.

Then there's HDDriver: on the SCSI list it appears listed under SCSI 3.0, IBM 0663, next an e, next Direct Access (like the other HD's)
Going to the format stuff, it won't appear here either: just the 2 Quantums and the Syquest listed again.

Beats me!!! I've got a huge pile of info on this drive from the IBM-site, but there's nothing I can link to this...

Something else: when powering up, the drive spins up normally, you hear the heads moving afterwards and that's it. Like the other drives. Next after about 10 seconds I hear a "Tack!" from the drive around every 5 seconds for a period of around 2 minutes, then this disappears. Drive continues to spin normally during this and thereafter. When rebooting this "tacking-sound" starts again for 2 minutes, then disappears again.
Something wrong with the drive or is that normal? I had one 100 Mb IBM drive once that did not and my Quantums don't produce this either.
I tried all the options during this "Tack-tack" and also when it disappeared after 2 minutes, no difference.

Tell you, the first IBM I had, stopped spinning after 4 weeks, this one won't work OK either, do you perhaps need an (IBM)-PC to operate these goods?

| . . . .

The Hades is expensive and cannot be used for playing games so that from that point of view the market is limited. On the other hand if you actually need a fast TOS machine with lots of memory and a large drive and CD rom etc then it is is very good. I was able to set off its cost against tax and that makes it a lot cheaper (or makes it seem a lot cheaper!).

I use my DirecT60 (i.e. Hades) in combination with a 21" black and white monitor for letters, reports etc. and I would not want to change.

I wonder if someone has Ghostscript 5.10 working on a machine with a
graphic card. On my Hades it just won't run. The program keeps me saying
that there is an error and that I can find more info about the error in
the console window. The message in the console however disappears so quick
I can't see what's saying.
The older Ghostscript version works without any problem on my Hades 060

That's correct. With MINTnet there isn't any wait at all.
I guess my ISP is one that's causing problems with STing because if I use
Sting I do get that 30 sec wait.

Certainly puzzling as the SCSI 'Format' is common to all drives. You
could always use the ICD SCSI.PRG and do it yourself (if you're REALLY
brave).

But why do you want to format it, Louis? Can't you just partition it?
You really don't need to format unless you want the 'bad sector' list
refreshed.

3386. Selling: Yamaha TG33 Vector Synth

Newsgroup: comp.sys.atari.st
Date: 1998-11-25 00:00:00 UTC
From: Stephen Cavender <sca964@gte.net>
Message-ID: <73i0i3$6kq$1@news-2.news.gte.net>
Source record: 89317
Cross-posted to:
comp.sys.atari.st,dfw.forsale,rec.music.makers,rec.music.makers.marketplace,rec.music.makers.synth,rec.music.marketplace

I'm selling one of my Yamaha TG33 modules. It's been called a "baby"
Wavestation by others. AWM sample based synthesis. Sounds can be created
using up to 4 elements. A vector controller (joystick) controls the mix of
the four sounds. The controller can also affect the pitch of the elements.

This seems to create a "swirling effect".

I've been told the joystick can transmit MIDI controller messages :)

It's in excellent condition and also includes a Xerox copy of the operation
manual. I have some alternate sounds for the synth that can be supplied on
a sysex disk.

I have excellent net references available.

Price: $250.00 + shipping.

Contact me for details.

Steve C

NVDI does do mouse acceleration (at least in version 4): just check the box
in the Compatibility CPX. However, that's the only control there is (either
on or off), so if you want super configurability of your mouse then you'll
need another accelerator.

Cross-posted to: comp.os.linux.misc,comp.sys.atari.st,comp.sys.be.misc,comp.sys.ibm.pc.misc,comp.sys.mac.misc,comp.sys.sgi.misc,comp.unix.misc

Hi there !!
I am currently making comparative speed tests between several operating systems, all with the same (free) software as a basis : POV Ray.
These tests now really have some importance for me, since it could give some kind of "reliable" benchmark to compare different systems, as well as different configurations with the same system.

You will find some explainations about the procedure on my home page :
http://www.chez.com/ybetemps

on the Amiga page ("speed tests" link)

By the way : ALL the results will be put as quickly as possible on my site, with the name of the sender and eventually the adress of his web-site.

Many thanks for your answers.
Yannick

Does it have a set of jumpers other than the ID ones? I have a
Seagate 548meg scsi in my TT, that I could formatt and then would
never show up at bootup. Called Seagate and it had those other
jumpers on the back and the tech told me to just remove the
jumper cap, did so and it's worked ok since then. This drive was
donated to me by a guy with an IBM system.

Less individual graphics, perhaps replaced by image maps, would be a
great improvement. All those little buttons take awhile to load in
Cab. A single image map (for each set of buttons) would be much
faster.

This sounds like a case of a drive requiring initiator identification, which
only recent harddisk drivers do. Trouble is the TOS boot loader routine does
not do it, therefore you can't boot. AFAIK many drives can be jumpered to not
require it. Get jumper info from IBM.

> The cheaper hardware remains to be seen: surely prices went down, OTOH
> with all the changing "standards" (PCI becoming extinct, now SIMMS

That would be bad indeed, fortunately it's not true, PCI is neither obsolete
nor becoming extinct. Sounds as if you meant ISA, but even that is not exact-
ly becoming extinct yet.

same here - I've been using a 100mB IBM drive (made by Western
Digital) that originally came out of an early IBM notebook since '93. It
did initially give me problems when running off my STe with the ICD Link
II/software (wouldn't recognize it until I rebooted - turned out I
needed to place it after my boot drive in the chain), but has worked
flawlessly under my Falcon. In fact, the ol' buzzard has outlasted my
Falcon's internal IDE, an NEC and a Seagate over the last three years!
BTW, when I went for info on the drive, IBM were most helpful and
prompt - it's really nice dealing with them, even with a used hard drive.

(BTW, my boot drive now is a really quiet, reliable 230mB Maxtor).

You've got a nasty little conflict there. I'd start by using Superboot to
get NDVI working just by itself (and WDialog and XControl). Once that's
done, start adding stuff until you find the "baddy". Then you'll have to
decide which you like better -- the "baddy" or NDVI. I suspect your problem
is a desk accessory, BTW.

>

Umm, I hope you had a real good surge protector. Consider this scenario: 1) big, but short surge hits 2) utility company equipment reacts, starts to shut down service 3) big surge passes 4) utility company equipment, which has just about killed off voltage, returns to normal 5) clock radio, which has a very small power supply (and few capacitors) goes out for a tenth of a second, resets, and begins blinking 6) VCR, which has a much larger power supply, takes a half second to fully lose power, and so does not reset (although the display probably dimmed at the time) 7) Falcon fried

Power supplies, unlike most electronic parts, age (actually, the capacitors age). Give an old capacitor a hefty shock and you'll kill it. Hopefully the damage didn't continue on to any of the chips.

NVDI and Warp 9 are pretty close in speed and compatibility, with the edge to NVDI in both. Warp 9 is much, much cheaper, though, particularly in the used market. NVDI has the printer controls, however, and although it does not come with a mouse accelerator, it runs wonderfully with Silkmouse, which is PD.

I just downloaded a few, and when trying to decompress them (with ST Sip 2.6 under 2 in 1) they all show up as having no contents at all, that is, no files are shown in the left window of 2 In 1 once I click on the .zip file.

This occured with the animated, desktop, computer and extra large archives.

Howdy Strichting,

Here's the address for Ghostscript 5.10:

ftp.rz.tu-harburg.de/pub/software/systems/atari/gnu/ghostscript/gemgs

Also, there's an English resource file with some English Docs at:

http://www.cix.co.uk/~derryck/software.htm

"English Documentation and RSC file for Ghostscript 5.10"

(The Cheshunt Computer Club for Atari owners)

Also, there are TWO versions available. One for the 68000, and one for the 68030, which the Falcon and TT use. Did you get the right one? If it doesn't work at all, try downloading it again. It wouldn't work at all for me, and finally (after much frustration), at someone else's suggestion I downloaded the entire thing again, and Presto!, it worked. :-)

Hope That Helps,

Clayton Murray

Perhaps there is a solution to this problem. Chances are that the
basic format for the printer drivers have not chaged from version
4.xx to 5.xx. My point here is that perhaps one could make a
printer driver in version 4.xx and than use that same drive when
running version 5.xx has anyone thought to try this out. I
would be more than happy to do this except for one little thing.
I don't have NVDI 5.xx yet. That is just a minor problem though.

give it a try and let us know if it works for you

What does "not official" mean? Note that there is a basic difference:
The LINK97 supports Quantum Fireball drives and to my knowledge LINK96
and LINK97 or the only adapters that do this by providing initiator
identification for the ST on hardware level. The LINK97 is only the only
host adapter to my knowledge that doesn't block the SCSI bus in a way
that only the ST can access it. If you want to connect more than one
computer to your SCSI chain, e. g. in order to use some devices from
different computers, you can't do that with another host adapter because
others will block .

GEM partitions are always limited, regardless of the TOS version. BGM
partitions can also be used with TOS 1.00 and 1.02 because it's not TOS
that's interested in the partition type but only the hard disk driver.
So there is no limit to 16 MByte even for these old versions of TOS
because BGM partitions are allowed for any TOS.

I can't help you with most of this, but this may help: Superboot
will not rename files that do not end in X, G, or C, as in
'foobar.prx', 'foobar.acx', which is how superboot does what it
does. For instance, Superboot shows me an 'enabled' cdaudio
accessory that I put into the C drive a while back with the name
'cdaudio.acy'. Of course, it doesn't run since TOS isn't fooled. But
Superboot believes it to be enabled anyway. Check to see that the
programs and accs you are controlling with Superboot have prx, prg,
acc, acx extenders.

You'll need a fullfledged imaging program to merge the two graphics,
then GrafTool to reduce it to 16 colors using the standard system
palette setting; clip and save as XIMG and then go to work in
ResourceMaster. In this case 'fullfledged' most likely means commercial,
because I don't know of any freeware/shareware TOS program that can
merge two graphics.

It seems to be a problem with STinG on some POP/SMTP servers. I have
this "30 seconds waiting" with my actual ISP, both with the SMTP and the
POP3 server, and I was told that it doesn't occur with MiNTNet.

A cheap and simple method for a real filesharing scheme, probably not,
but you can always try a serial connection with a Zmodem compatible
terminal program.

3417. UK Give Away: New Computer Express

Newsgroup: comp.sys.atari.st
Date: 1998-11-25 00:00:00 UTC
From: Brian Watson <brian@spheroid.demon.co.uk>
Message-ID: <911995496.1073.0.nnrp-04.9e98ea3a@news.demon.co.uk>
Source record: 89436
Cross-posted to:
alt.c64,comp.sys.amiga.misc,comp.sys.amstrad.8bit,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.msx,comp.sys.sinclair

I have two boxes full of New Computer Express magazine to give away to
anyone who wants them (they were given to me).

As they start from 1988, they offer an interesting and informative insight
into computers the UK then.

Due to the weight of the set, I suggest that anyone who wants them should
e-mail me first at brian@spheroid.demon.co.uk to make arrangements to
collect them (from Cambridgeshire).

This will have to be in early December as I shall not be available to hand
them over until next week.

Alternatively, I don't mind arranging shipment for just the price of the
carriage charge.

Hi Nick,

which Port on a Falcon may I use? I have an old AppleTalk Cabling with
those Split Boxes und Cables. May I use this?

That early?. The only Compaq's I've seen from that era were 286 machines,
but then I haven't seen them all :-)

Being that the 386SX is also a 32 bit processor, with a 16 bit external bus
the same reasoning would then suggest that the 16/32 bit MC68000 is also a
32 bit processor wouldn't it?

Regards,

Clockmeister.

Well, a serial connection is usually through the Modem port (called
Modem 2). I'm not sure if there was any software that used the LAN port.

Hi Louis,

Well, I don't know about the 'Tack' business, unless it's the drive
recalibrated (but I don't think so).

But, I've had an IBM 0661371 (3.5", full height 305MB) working here
without flaws for a year and a half. So, there has to be light at the
end of the tunnel...!

Good luck with your 'quest' :-)

Martin,

GhostScript 5.10 works fine with my Nova card and TT030. The only
problem I have had is that I can't get some PDF files to display more
than 10 pages. Others have reported similar problems.

By the way - having messages in the console window go by so quickly that
you can not read them is a problem I think I could live with :)

Hi Peter,

could be that's the problem. Although I got a little further now, have
some jumper info from IBM, but now the system boots but I cannot do
anything with the drive. ID-checks list the drive, but no format/partition
options. Tried it with 3 drivers... (well, tried it running from Hushi,
with 3 different programs). The strange part is that IBM says there should
be 3 ID jumper positions, an option pin and then the autostart jumper. So
far so good, but then *this one* has another 3 jumper positions, that are
not mentioned at all in the docs. All on the same strip.

I was merely talking after my visit to this HCC-fair last Sunday. This
being one of the biggest PC-fairs over here, and what I saw was all this
APG stuff. Hardly any PCI card to find. Same for SIMMS, it was HARD to
find 32 Mb types. Only 2 pieces of 64 Mb to find on the whole floor, one
of which was good enough for me :-) Had I been looking for Dimms, I could
have had 9 zillion Tb sitting in my computer right now...

Charles, there is another one sitting in your Cache folder, but under a
different name (aaa00d01.zip or something). Only way to find out about it
is checking your cache with the relevant module...

Your listing under b) and c) surprise me... sure it's not being specified
somewhere?

Sorry, have no explanation for these two :-) But you should have plenty of
b/u copies!

Actually, the LAN port is an RS-422, similar to early Apple machines.
There are a few limitations about their usage on Atari machines, but
these are well detailed in CHIPS555.HYP by Michael Ruge.

Sounds as if the drive is not ready to be accessed. It's probably simply
broken.

> Atari ST format floppy disk.

For non-french people, a "soft" is the french word for "program".

I assume you're talking about disks with data, not games.

If it's a 360K single sided disk, then you'll probably be out of luck,
as some PC drives cannot recognize them, whatever you do.

If it's a 720K double sided disk formatted on the ST, then in some cases
the PC will have trouble reading it.

You could try using an emulator such as Pacifist or Winston, and a
program to make disk image files like makedisk:
http://pacifist.atari.org
http://winston.atari.org
http://makedisk.atari.org

You could also try a program like ST2DOS, available from the Quick FAQ
where all this issue is extensively covered. This program writes a PC
bootsector to the ST disk, This can screw up games or auto booting
disks.
http://quickfaq.atari.org

If you still have an ST to play with, just format DD 720K disks on the
PC, and copy your files over to those disks.

Yes, the hardware may be compatible, but was any software ever written
to make use of the ports ?

If you format the disc to 720Kb on the PC it will be writeable on the
ST and readable on the PC.

Well, it doesn't sound normal. It's not the usual 'recalibration'
noise from the sound of it.

>Tell you, the first IBM I had, stopped spinning after 4 weeks, this one
>won't work OK either, do you perhaps need an (IBM)-PC to operate these
>goods?

Apart from suggesting you find a PC with SCSI you could try it on I'm
a bit stumped.

I had a second-hand IBM drive (WDS 3160, I think) some time ago which
refused to work. After A LOT of messing around and phone calls I came
to the conclusion that:

Only a very small proportion (Identify, Spin Up, Spin Down, Sense) of
the SCSI microcode was in ROM.

The rest of the microcode was loaded from a secret HD location on
power-up.

My drive was not able to access this part of the drive.

Mind you, this drive never started up properly. I could not hear the
normal SCSI POST sequence.

>December 31, 1. Thus, 2000 years will have passed on December 31, 2000.

Yeah, sophism... The calender we use is a theoretical construct
devised long *after* the birt of Christ.

Can we agree on the fact that the *second* millennium started on
January 1, of the year 1000? Then on December 31, 1999 a thousand
years will have passed sence then, and we're going to the third
millennium.

Or do you want to contend also that the twentieth century started on
January 1, 1901?

Hi!

In article <73hjb8ieo1@irk.zetnet.co.uk>,
jlog@zetnet.co.uk (JI Logan) writes:
> How do you know there was no year zero?

Because it's a fact. When the counting of years as we know it was
introduced, the number "zero" (and negative numbers) were not common to
those who did it. Therefore, we have "Before Christ", and "Anno Domini",
but no years <= 0.

See

As I have said, I've been having the out going e-mail do that
30sec wait, this is what happens ...

I type a message, I hit send... the tx & rx leds flash back and
forth real fast, then nothing happens ... the dialog says
connecting to host ... the tx led flashs one or two times ...
then the box says sending request ... Then at last the two leds
flash toghter and the mail gets sent. BUT a lot of e-mail I'm
sending out doesn't seem to be getting to where I'm sending it.
So far about 1 out of 10 messages get out.

Yet the messages for the newsgroups go out just fine.

my settings, the STinG delay is at 10. the MTU is at 576.

under the TCP CX it says Max Segment size 1000
Rec Window 1000
Local Port 1024
Default TTL 155

Does this look ok?

Uwe, I think you're right... :-(

I checked once more running from HDDriver, then the ID-check will list the drive correctly, but when selecting it all the options about cache, parity-check and Unit-attention are greyed out... Unless there's something in IBM's docs I missed. Enabling SCSI-initiator (on ID-7) didn't do anything either.

Well, you can't win 'em all...

Well, I had a look with Cab 2.5 on a TT running Magic, and I have to say I found the pages difficult to navigate. Firstly: Frames Bite! Especially when the text runs off the edge of the page and there are no scroll bars to allow you to see what's written. Secondly: That server is impossibly slow.

Which is not to say that your efforts are not appreciated, especially once the "ownership" issue gets ironed out. Personally, I'd just like to see some of the fanciness of the page removed in favour of more functionality. I mean, if I am going to have to navigate through six frames/pages only to get referred to L.A.P.D.'s list (but no downloads), I'd rather use Hallvard's FTP launch page, and get there faster.

My $.02,

What do you found too "fancy" ? background pictures ? HR bars ? I
attempted to make the site have a good look (even if my bars aren't very
nice : I gonna change it soon...) without making the connection time too
long. What's making the site "difficult to navigate" ? Frames ? Laconic
buttons ? :-)

>I mean, if I am going to have to navigate through six

Simplified graphics and losing the sample that played on arrival at the site which will help loading speed - I'm sure that there will be some links that are still faulty but Jo repaired at least the couple I reported so hopefully it's up to date.

>than 10 pages. Others have reported similar problems.

The viewer is older and cannot cope with some PDF files unfortunately.

As a workaround you could use the Print... section to a pswrite file (make sure that you've a bit of space free) and then view the resulting PS file in the viewer.

>By the way - having messages in the console window go by so quickly that
>you can not read them is a problem I think I could live with :)

Even on a Nemesised Falcon the messages whizz out of the window - there's a couple of messages that appear when I quit that I'd like to be able to read!

Do you mean NVDI 5 drivers?

NVDI5 seems to use a different technology to drive printers, PCL or ESC/P2
so that probably explains why makeprn won't work.

Get Pc-exchange for MAC. You might have it allready. Format a PC compatible disk on PC-exchange then put the disk in the Atari and save the files there and bring it back to the mac and using PC-exchange once again read the files. Mac doesn't read PC/DOS disks without PC-exchange but Atari does. Hope that helps a little.

Joshua.

Hi Louis. I have an IBM XP31070W 1G (internal) connected to my Falcon and
it Tacks when reaches its operating speed and then randomly after (not as
often as yours). Given that the drive has no problems (beyond that it
takes a while to spin up) I assume that the tacking is normal.
On the other side, it may be you have a termination problem... is
the TRM power jumper enabled? Also try disconnecting all the other devices
from the SCSI chain and power up with different combinations.

Regards.

Daniel.

Louis (louis@holleman.demon.nl) wrote:

: Something else: when powering up, the drive spins up normally, you hear

Hi John,

I just sent the drive back to the firm where I bought it... Gave 'em a
call this morning and they suggested to send it in for inspection. If it
proves to be faulty I would get a new one or my money refunded. Not too
bad... especially considering the drive cost me USD 75,-

But the tip might be usefull for another try if another one will be sent
and I encounter problems again.

> nice : I gonna change it soon...) without making the connection time too
> long. What's making the site "difficult to navigate" ? Frames ? Laconic
> buttons ? :-)

Well, given that the page is designed to simply point at other servers
that have the stuff, it is a mid-point in the process of finding and
downloading software. To that end, I feel that having to grind
through several different front pages that in turn give me access to
different frames that give me more access to more frames etc., etc.,
I'm growing old here!

So, to reiterate, Frames Bite! Especially with Cab, where pressing
the "Back" button does not take you back to the previous frame, but
rather to the previous page, whatever that was. Navigating through a
bunch of nested frame references with the pop up menu, which is
frequently too small to display the full html address to allow me to
see the actual page name.

Bottom line, I want to get in and out in minimal time. How about
setting up a simple, frame-free front page that lists the various
categories which, when clicked, take you to a second frames-free page
with the alphabet table at the top followed by the list of programs.
An added benefit would be having the whole screen available to see the
various things as they scroll by - hey, I like to browse. Then, I
find what I want, punch the link, and bingo I'm gone.

Does this help?

>December 31, 1. Thus, 2000 years will have passed on December 31, 2000.

Actually, 1000 years...

Also, the question of WHEN the millenium comes is purely academic, for a number of reasons, not the least of which is that the calender didn't start until several years after the year 1 B.C. So, by that reckoning, the millenium ended somewhere like 1996. Whoops! We missed it!

An excellent and detailed book on the whole issue of calendarics is Stephen J. Gould's recent "Questioning the Millennium".(Harmony Books).

3486. FS SC1224 monitor and XE game system

Newsgroup: comp.sys.atari.st
Date: 1998-11-27 00:00:00 UTC
From: mlunde@geocities.com
Message-ID: <365f35e5.3901322@news.win.bright.net>
Source record: 89264

I want to sell my XE game system and a ST monitor SC1224. I am
interested in just getting them a good home. So, I am asking.

And this includes shipping as long as the shipping doesn't go over
this price. USA only.

$25 for the monitor
$25 for the XE game system.
-- has all original hardware and I think all the manuals
-- like the flight sim and bug hunt carts etc.

If interested email me at mlunde@geocities.com

Thanks

>your impressions.

I've my Hades one year now. In the beginning I had some troubles to find
the right configuration but now the Hades runs like hell.
From time to time I've problems but this is mostly due to the fact I'm
using all kind of beta versions of programs.
Right now I'm running freeMiNT 1.15.1-0.1 (the 1-03 has a serious
nuissance) together with N.AES 1.2.0, NVDI 5, novaVDI 2.61 (graphic card
driver), Thing 1.27 and quite some other bits and pieces.
AFAIK it's the most up-to-date configuration.
My Hades 060 has an ET6000 graphic card with which I can get a resolution
up to 1024x768x16m or 960x704x24b.
On 24 b color mode the Hades is considerably slower but its still some 7
times faster then a TT030. With a resolution of 1024x768x256 the Hades is
depending on the setup I use between 10 and 13 times faster then a TT030
running in ST high.
I use very often Calamus SL98 (SL95). Using this program is just like a
dream, bloody fast indeed. I just did a little test with SL 95.
On my TT030/TTM195 screen with almost the same configuration it tooks 14
secs before Calamus SL 95 is up and running. On the Hades with a 17"
screen and 256 colors it tooks only 5 secs.
Loading the colorcub.cdk (178.637 bytes) on the TT030 takes some 27 sec.
The Hades 060 needs only 7 secs.

I downloaded all of them late last night, but haven't had a chance to
look them over yet. I'll get back to you after I've done so.

Thanks for making them available.

That's what the Site-Map is supposed to do. But, now that it resides
within a frame it can no longer be the entry point under CAB. :(

>That's what the Site-Map is supposed to do. But, now that it resides
>within a frame it can no longer be the entry point under CAB. :(

Well, I gonna make another map of the site (even if I'm not very good at computer graphics... :-)), so that it is a realistic map of the new structure of the site. But this is only IF I continue to host the UTSI. As it seems that I'm not the only guy who thought to do it, I don't want to be said a thieve, or anything else... Well, in fact nothing negative has been said yet, but I'd like the situation to be clear : the reason why I grabbed the site is my _deep_ admiration about the enormous amount of work done by Jo, and my sadness to see such a masterpiece being abandoned. I often went to the UTSI to found software, and grealty appreciated the site, that's all. I grabbed it for my pleasure, and for the pleasure of Atari users, that's all... I don't want problems. I only want the UTSI to become better and better. I'd especially appreciate to get an answer from Martin Byttebier (or even Jo, if he's still there ?) about the "UTSI affair" : is there a problem with the hosting of the UTSI on my association's site ?

Well, now that things have been told, I gonna think about the problem of the "entry point"... :-)

Yann Lossouarn / Falk'Asso

3494. UTSI : let's vote !

Hi again !

I propose you a deal : about the miscellaneous problems that are occuring about the hosting of Jo's UTSI on Falk'Web, I'd like to receive a substantial amount of answers from you. Here are the questions :

- is there a problem with the UTSI's hosting on the Falk'Web (ie : do you want it to be hosted somewhere else ?)
- do you want the frames to be removed ? If so do you want ALL the frames to be removed ?
- do you want the headers to be included again ? If so which one (the sections list, the general header ?)
- do you want the background pictures to be removed / changed (other colors ?) ?
- do you want the pages to be pictures-free / as is / more pictures !!
- would you prefer to have only 1 frame page, with the sections at the top and the main frame at the bottom ?
- would you like me (or someone else... :-)) to include direct links to the page of the software included in the News page ?
- every other suggestion is welcome... :-)

I reckon you're talking about AGP. In that case you merely paid attention
to graphics cards. AFAIK the AGP is an extension to the PCI that is optional.
Meaning AGP cards would work in a normal PCI slot. But I'm not sure.

> Hardly any PCI card to find. Same for SIMMS, it was HARD to

If it's not a trade fair, then why should they display low-end hardware.
Maybe that's the reason you've only seen state-of-the-art stuff.

That's nonsense. These parameters never should be the same. Instead the
receive window should be a few times the maximum segment size, for
instance 5k here.

> Default TTL 155

Too large, but it shouldn't do any bad. 64 is a good number, going beyond
twice of that doesn't make any sense.

However, neither cannot really explain lost mail. Maybe a broken mail server ?

Cheers Peter

> STeve scoTT

Well, if you are after a fast machine with good expansion possibilities and room for lots of RAM then perhaps a Hades would be the machine for you.

I have a Hades 060 with 32MB of RAM which I have been very pleased with during the past year and a half. Although I do not run a DTP package myself (although I know somebody who is waiting to receive Calamus SL98 for his Hades) I do use Papyrus which runs at a very useable speed.

As Atari programs are generally far less memory hungry than their MS Windows equivalent 32MB of RAM is a lot of memory. I can have OLGA, BubbleGEM, GEMSpooler, QED, Hisoft Basic, Twilight, Xcontrol, MiNT, NVDI, Thing all running together without even coming close to using half of the available memory.

The only real problem I have had with my Hades is with its graphics card and drivers. I have an ET4000 and I currently use NVDI 4.11 ET-4000 (soon to be NVDI 5) to drive it. I have yet managed to reach the Hades 32K and 64K colour modes, and I do get the od black pixel appearing in the menu bar and on the screen but I can live with this and I know of other Hades owners who do not have this problem.

There is a list of Atari Clone users on Lonney Pursell's WEB site which currently contains Hades and Milan owners along with details of their systems and their E-Mail address:

http://www.bright.net/~atari

If you need any more details of the Hades E-Mail me.

Regards,

Ben Hills.

Use 720K DOS formatted disks.

It's another topic but IIRC the Speedo drivers can print through the LAN
port too.

Bye,

```
***STOP PRESS***
CyberSTrider now takes US Dollar cash and cheques too.

As most of you know by now, I have special offers and discounts for
the festive season on Shareware I distribute. Below is version 2 of
the order form (version 1 was a few days ago).

This includes a few more shareware that has been discounted, plus
Floppyshop commercial software which is discounted too!

Offers end 31 Dec 98 so get your orders in soon.

Please note that I can only guarantee delivery before Christmas where
Master Disks are not involved (and I do not have to rely on authors to
generate keycodes and I have the keygens instead).

Enjoy!

Regards
Danny

This reminds me of IBM DPES 1 GByte drives that are not properly
terminated. You get similar effects with them.

>This reminds me of IBM DPES 1 GByte drives that are not properly
>terminated. You get similar effects with them.
>

Uwe, the docs (found on the IBM site) say the drive has no built-in
termination. User is supposed to terminate the SCSI-chain by himself.

That's why it sits in the middle of my chain, the CD-ROM being the last
one and being terminated.

From the docs:

The drive has no internal SCSI bus terminators. The user is responsible
for properly terminating and powering the SCSI bus in the system.

Options Jumper Block:
The jumper block is used to select the SCSI drive ID, to control the
spindle motor start and to select the appropriate option pin function.
There are four ground pins. If the option pin is jumpered to ground, drive
initiated synchronous negotiation is disabled, but requests from the
initiator will still be accepted. Option block ground pins must only be
used for selecting jumper block functions.

With the auto start jumper in place the motor spins up when power is
applied. With the auto start jumper removed the motor spins up when the
drive is issued a Start Unit command.

Note: During the powerup sequence the option pin is interrogated. If it is
grounded the pin remains an input. If it is not grounded it becomes
an output, indicating motor active or command active depending on the
state of the CMDAC bit in mode page 0.
As an input the option pin has several effects upon the SCSI
function. Please refer to the 0661 SCSI Specification for details.

Sofar the docs.

I have the autostart jumper in place. The option pin is NOT grounded.

Any comment on this?

Steve,

I must have been sleeping... MegaVision-300, yes, I've got an article on
it from April '93. Card should be able to do 640x400x24 or 1280x800x8.
According to the test, the installation program was A-1. Testing the card
however showed that running 24 bit mode was very limited because the
driver only supported 8 bit and to get more, the software you were running
had to "speak to the hardware" directly, which was only possible for 3
programs at the time. Regular programs that supported 24 bit, wouln't run
in that mode on the card. Also the card was S-L-O-W!
So I dunno whether or not better software has been developed for this
card, let alone that 24 bit drivers are available. Perhaps someone might
jump in here with info, also on the makers?

I upgraded my hard drive to a 1Gb Micropolis a while ago, and it took
about 2 weeks of messing around before it would work, and has now been
running 24hrs a day for the last 3 years.
I use a Gasteiner adaptor, and had to partition the drive with the
Gasteiner software, but then use the ICD driver. The max partition size
was 256Mb. I seem to remember something about the drive ID number
causing problems when trying to partition.
Try all the options, ie with just the one drive connected instead of
three, different software, test the drive on another system etc. You'll
probably get it going eventually.
Good luck
John ....

> icons in some cases. A lot of work!
> But anyway, all the hard work is over with as you can see, even if I had
> to edit some icons pixel by pixel...

You can ofcourse do it the easy way ;-)

* Open the icon-editor with the icon you want to merge from.
* Press <shift>+<control>+c. Nothing seems to happen, but...
* ...now you can use the mouse to select an area to copy. Click once,
drag, click again.
* Open the icon-editor with the destination-icon, press <control>+v
and position the selection. Finish with a single click.

That's it, the two icons are now merged. Experiment with the mask to
see how it works, it's really very simple once you've learned it.

It seems to me that I have run into this before. I routinely use
Diamond Edge to partition the drive, which it attempts, but then
reports that it cannot do. I then run ICD and it finishes the job.
Worth a try.

: I reckon you're talking about AGP. In that case you merely paid attention
: to graphics cards. AFAIK the AGP is an extension to the PCI that is optional.
: Meaning AGP cards would work in a normal PCI slot. But I'm not sure.

Sorry but AGP is not an extension to a PCI slot. Accelerated Graphics
Port (AGP) it is run by a special chip and is 10 faster than a PCI slot.
Thus an AGP card will not work in a PCI slot.

Note, this is the port that should be added to the Milan 68060 at 80Mhz
this would secure its future.

3525. Re: HADES 060 way to GO ???

Newsgroup: comp.sys.atari.st
Date: 1998-11-28 00:00:00 UTC
From: paul.williamson@zetnet.co.uk
Message-ID: <73p547$6pn$1@roch.zetnet.co.uk>
Source record: 89200

Hi all,

Just my contribution to this thread ....

I have got an 060 Hades with the ET4000 graphics card, 17inch monitor, 2.5gig internal drive, Syquest 230 external, 56K modem on Modem 2, Midi ports ROM card (for programme dongles).

My overall impression is that this is a superb machine. It does what I want it to do very quickly indeed, with a large monitor running (mostly) at 1024x768x256, although sometimes I increase it to 1200x832 or 1280x960 depending how I want to work.

However, it has taken quite some time since I first got the machine for me to get it set up and running as well as it is now, and I still have some problems as yet insolved, but they do not affect my work or the programmes I wanted to use when I got the machine.

My recommendations to anyone thinking of getting a Hades are:

1. Be prepared to configure it in a way that you may not have had to do before. (Before the Hades I only had a Mega St which was simplicity itself, and "Inf" files were as foreign to me as "Sys.ini" files on a P.C.)

For example, on the Hades you may need to adjust the cache switching individually for different programmes. Most of my software runs fine in my normal set-up (Thing desktop, Selectric, Sting + Dialer, Winx, and various other bits and pieces) but when I run Cubase I re-boot to as clear a system as I can as Cubase does not like having some of the other programmes running - esp Winx.

2. Think of the Hades as a modular machine, with a choice of graphics card, HD size, amount of memory, with or without ROM card, monitor size and type etc. and allow for this in your costings !

I suspect that the ATI MACH 64 is probably about the best graphics card available at present but it is very expensive compared to the ET4000. Unfortunately, just buying an ATI MACH card won't do, you need the supplied drivers and I understand they are the cause of the extra cost as compared to buying the same card for PC. At the moment, neither Ben Hills nor myself can get more than 256 colours with the ET4000 card (this is one of the problems I hope to solve), but I cannot use the ATI MACH card as it conflicts with Cubase. I also suspect that the ET6000, which Martin Byttebier uses, is now rather hard to come by.

3. There does not seem to be much (any ??) support directly from Medusa computers. However, there is a lot of support on the web, and other

Hades users have helped me a great deal, thanks folks :-))

Martin mentioned comparative speeds with Calamus, here's a Cubase comparison: An "autolayout" on a large score on my Mega ST (which had the T28 accelerator and NVDI 3) took 3mins 22 secs. The same task on the Hades takes 22secs.

Midi ports - not standard but easily fitted.
ROM ports - likewise. The card has room for three dongles. Two internal and one external and the "Inf" file lets you select which one to use.

I understand there is also a (very expensive) sound card available with its own software for direct to disk recording.

Medusa computers are at http://www.stud.ee.ethz.ch/~caschwan/medusa.html
The site is accessible, but at present their E-mail address is not working. System Solutions and Titan Designs supply Hades in the UK.

Hope this helps a bit. Do mail me direct if I can help any more, especially regarding Cubase, midi ports etc.

Cheers

Paul

STD Cat 5.0 was on ST Review coverdisk September 1992. I don't know if the program is still available commercially if not mailme and I'll try and find the disc and mail you a copy.

Personally I use STDATA a database program that came bundled with the Atari. An old but very efficient program that you can customise/design databases with.

Hi, I let Freedom load the CPX... plus I let it (the CPX) load the Palette
file that came with Jinnee (slightly modified standard palette). You can
set it to load and display any palette you'd like, even a 256 greyscale
one. Next I use a window-colors CPX to change colors of my windows.

Agreed. I had to replace the PS in my Falcon a few months ago, and the one I got from Best was the best built and best running one I've ever had in a Falcon. It runs very cool, and my Falcon runs better than ever. Even the display improved. It's Atari-made, but obviously much better made than the one it replaced. It even LOOKS much better made.

How about a little of both? ;^)

Actually, you should be commended for such a great job of organization and making so many icons available at one place. I'm always in the search for new icons, so it's great finding so many available in one place.

Having said that, since I don't use monochrome icons, only the animated archive was of interest, and unfortunately, none of those icons piqued my interest (or I already had them). That's not a complaint, but merely an observation.

Also, I'd like to echo one person's suggestion that they be made available in one archive. Or perhaps two, one for mono and then the one for color icons. It wouldn't be all that large, and would still have the benefit of organization, provided folders were kept intact.

But again, you should be commended for your hard work. I do appreciate you taking the time to help out the rest of us.

I have no problem with it. Gives us a backup site, if nothing else.

> - do you want the frames to be removed ? If so do you want ALL the
>frames to be removed ?

Simplified frames would be nice, but designed so that people who
don't want them don't have to use them (see my previous note). And
if you do use them, the navigation bar should not change (not sure if
it does now). Sites that use frames, and then change them every time
you click on something, don't make a lot of sense. The whole idea of
frames is that part of the screen stays static while one individual
window changes with each selection. If you're going to use new
frames with each selection, you might as well use tables to separate
everything instead.

> - do you want the headers to be included again ? If so which one (the
>sections list, the general header ?)

Not sure what this means.

> - do you want the background pictures to be removed / changed (other
>colors ?) ?

No opinion one way or another, but bg pics should be fairly small and
load pretty fast.

> - do you want the pages to be pictures-free / as is / more pictures !!

Less graphics is generally better with CAB. Converting individual
buttons to one large image map would be preferable.

> - would you prefer to have only 1 frame page, with the sections at the
>top and the main frame at the bottom ?

Yes!

> - would you like me (or someone else... :-)) to include direct links

> Well, now that things have been told, I gonna think about the problem of
>the "entry point"... :-)

That wouldn't be a problem if you designed your site to run with or without frames. Then they could just point their browser at the appropriate page. They wouldn't get the frames, but would start where they want. My site (URL below) was designed that way, and it was very easy. The navigation bar is always there if you want it, but each page still allows you to get where you want without it. And people can start at any page they want.

Personally, I like simple frames with navigation bars at the top or on the side, provided they're not too large. Yours is a bit big, though it all fits on my 800x608 screen without the need for scrolling. I can see where people with smaller screens would have problems, though.

3535. Olivier Booklage's CAB.OVL

Newsgroup: comp.sys.atari.st
Date: 1998-11-28 00:00:00 UTC
From: outrider@lvdi.net
Message-ID: <365fb450dd45484@lvdi.net>
Source record: 89210

Just started using Olivier Booklage's CAB.OVL last night, and so far I'm pretty impressed with it. It's a bit early to guage too much how it stands up with Dan Ackerman's fine CAB.OVL, but I certainly noticed some advantages:

* Quicker response. I'm not sure if overall speed is faster, or even as fast, but when you ask it to do something it's definitely faster. For instance, when I start a background download, it almost immediately starts, instead of going though a ritual each time before the download actually starts. Actual pages in CAB seem much more responsive, too.

* No annoying redirection alerts, which make some sites nearly unusable. So far it seems to handle redirection fine, but you don't have the alert pop up for every single graphic. IOW, it's all handled quietly and seemlessly.

* The configuration interface (using an internal html) is very nice and very easy to use. It's also very flexible, allowing you to individually set timeout periods for first try, second try (!) and data stream. I love it!

* So far I haven't lost any graphics because of time outs, which continues to be a problem with Dan's version. A couple times it apparently did time out, but it gives you a dialog asking if you want to abort or try again. Both times I tried again and it grabbed the graphic immediately. Very cool! No need to reload a page once or twice to get all the graphics.

* Lots of other little goodies included, which handle various errors and often times give you a chance to correct them. For example, if you make a download that ends up with an unexpected number of bytes, it gives you the chance to keep it as is, or try again.

On the downside, sometimes its error handling is a bit TOO good. There were times I got a lot of errors, such as bad html headers (whatever that is), or unable to access a CGI, or a space in a pathname (which it should handle anyway), and it kept me busy handling the forms that kept popping up. Some of these should probably be handled quietly without user intervention.

Also, during one AutoSurf, I kept getting file errors for some reason. It kept asking if my disk was full, but I have a few hundred megs free on that drive. I suspect that it was either encountering a file that already exists, or perhaps a file that was already open. This needs a little work.

All in all, I'm very impressed, considering it's my first version of it, and its development has been kept pretty quiet. I'm grateful for al of Dan's hard work, and am glad to have his CAB.OVL, but it's also nice to have this new alternative. It shows a lot of promise.

Here's the URL, for those who missed it (thanks, Peter!):

Really a simple solution to this would be to put in a zip file of
all the icons and have them also available by the individual zip
files. This way if you want the whold thing you can download it
and if you choose one or two you can go that way also. Seems to
be a simple solution to this problem huh?

>or replaced.

Hi,

Sounds the internal PSU blast up..

That's a "standart" defect. If you can't fix it, chance the
hole psu, get another one from best or some else.

Don't replace the fuse again, check rectifier first, desolder it.
Replace fuse, if that ok, replace rectifier. (e.g a new one)
Same type of rectifier!

If it's not the rectifier, test transformer, transistor..

Don't chance any part of the psu with parts from somewere..
Use only same parts!

Hope that helps.

Regards, Robert

Hi Paul (and others),

I am considering a Hades 060, or a Milan 060 or eventually a Centek 060 as the successor for my TT. This one is 10 years old and it shows. OK, I put a nice GFX card into it, extended the memory to 64 Mb fastram, but the processor is still a 030 running at 32 MHz. On average it's perhaps as fast as a P-75, maybe a P-120 but that's about it. When I look at a friend's machine (P-300), simply D/L a JPEG and next displaying it, I'm stuck with a s-l-o-w machine. For word-processing it's good enough (I don't do documents for DTP, I don't write new Bibles or something, so the old fashioned That's Write 2.05 (Dutch version) is good enough for me). I'm not running Cubase 2.01 anymore, don't do HD-recording, so I don't need a fancy machine for that either. Booting? Fast enough. Internetting? Fast enough. Displaying graphics? Well, it could do better on displaying piccies, but for Internet it's good enough. Sound? Well, it's 8-bit DMA only, but I got my stereokit also and for the average "ping, pong and Sorry Sir!" this old 8-bit DMA is good enough. Don't need a 64-bit sound card for that...

What I would like however is my future machine to display at least 24 bit colors... I'm used to that on this one, so I'm not going back. I know, the guy operating a STf on a SM124 would probably think "Wow, 256 colors!", but I'm used to 832x624 in 24 bit already, so I wouldn't go for less... It looks like the Hades 060 has some problems here... If that's a fact, it's simply out of the question for me. I think the 040 Milan does already a better job than that. What strikes me is the mentioning of Medusa not giving much support. Well, would they on the Medusa then?

Sometimes you (I) think: OK, it's a 1988 piece of hardware, but I can come along real nice after 10 years. Aixit telling us, our new TT-RAM board supports up to 256 Megs of RAM. Well, the lucky bastard who's able to find ONE piece of 128 Mb SIMM gets a 1794 Mouton Rothschild for free...!
The problem is, the card accomodates only 2 Simms, so you better start looking around. Why da heck you think I've been looking for 64 Mb types lately? Right now I can accomodate another 64 Megs, provided I find another Simm.... I hear you think: another 64 Megs??? Well, lemme tell you: Graftool is very hungry... try to load 10 "nowadays" JPEG's and you know what I'm talking about...

A shame really... a friend of mine ran an STe on an ET-4000 several years
ago in 15, 16-bit and perhaps 24-bit too (don't know that for sure). The
STe ran at 36 MHz and a bus speed of 10.somuch, litterally the max. it
could support... It WAS a fast machine, then...)

Hi Martin,

I just wonder what nuissance you mean. I had trouble with 1-02 but 1-03 runs OK here on almost the same machine as yours. (Hades060, ET6000, MiNT 1.15.1-03, N.AES 1.2, Thing or jinnee)

>When is a upgrade not a upgrade ?

In all fairness, I finally managed to find the proper NVDI 5 settings and now my printer acts the way I want so I've lost nothing and gained quite a bit. Personally, I'm very happy with this upgrade.

Now, if my printer *weren't* supported, I'm sure I would feel very differently. ;-)

There obviously exists a printer driver creator for NVDI 5 because these drivers were created somehow. Hopefully, 2B will one day choose to make it available.

I'm quite happy with Thing, too. It seems to support the features I want
and missed after moving from Geneva/NeoDesk to MagiC/Magxdesk, and
much more. It has been very stable and InterActive made registration easy.

>you want it to be hosted somewhere else ?)

The final hosting should be resolved between those directly involved, IMO.

But, I appreciate your efforts to capture the UTSI pages. I read your efforts as taking the initiative and *not* an attempt to cut anyone else out.

I read the original thread and it appeared to me, as I'm sure to you, that the UTSI pages were about to die and that Jo, other than moving them to GeoCities, made no arrangements for them to be supported. It also appeared that Jo was gone -- his subsequent post indicated surprise that he was still able to send/receive NEWS.

> - do you want the frames to be removed ? If so do you want ALL the
>frames to be removed ?

I honestly don't see where frames help with the UTSI pages.

> - do you want the headers to be included again ? If so which one (the

> - do you want the pages to be pictures-free / as is / more pictures !!
> - do you want the background pictures to be removed / changed (other
>colors ?) ?

UTSI has always been difficult to navigate. Too many graphics. Too many useless levels.

So, keep the graphics minimal. Restore, and maybe simplify, the overview page (which currently doesn't appear to work very well) and let that be the entry point.

I couldn't get this to work so any suggestions would be appreciated.

Let me add to Terry's list, which I certainly agree with, that the biggest improvement is that the "Connecting ..." hangs appear to be gone. It appears that this OVL recognizes the error and returns the dialog, as Terry mentioned. The hangs are not CAB/OVL's fault but the new OVL definitely appears to handle the fault better.

Well, I changed the setting within STinG, And everything seems to be about the same, I just wish Newsie would SAVE the log instead of deleting it every time.

I just sent out 3 copys of the telescope buyers faq file, 2 of them to other people, one to myself. Now when the other two went out, (this file is 97,000bytes long) the modem lights would flash two times after the 30sec wait and newsie would say mail sent, this took about 2 to 3sec's after the wait time. The one that came to me, I watched the lights as it was reading the whole 97,000 bytes and sending it out, about a 10 sec read and export. I don't know, but it sure didn't look like it went out to the other two people.

3557. L.A.P.D. library enquires

Newsgroup: comp.sys.atari.st
Date: 1998-11-28 00:00:00 UTC
From: Steve Stupple <Steve@steverosie.demon.co.uk>
Message-ID: <gy2qFKArlHY2Ew2Y@steverosie.demon.co.uk>
Source record: 89232
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,alt.atari,demon.ip.support.atari

Hi

If anyone has any enquiries regarding the former public domain library known as L.A.P.D, I'd be grateful if you'd direct them to me at the following email address - lapd@steverosie.demon.co.uk

I have taken over, added to my own and hopefully be able to keep some PD/Shareware support going.

At present I will honour the previous prices, as sorting things out will take a while so please be patient as Rome wasn't built in a day; although you can roam in a day:)

I've had to swallow my pride and start to use my PC for internet access especially email. Newsie could no longer be viable due to the restrictions on the mailboxes.

The trouble with PC's are that you have to back up data regularly, something you could get away with on the ST's as they are more reliable and stable. Run a wrong program on a PC and you WILL have to reload ALL the operating system from scratch:(and it's took me a FULL 7 days.

I thought that the Y2k (year 2000) problem was the biggest money spinning con going until I met the PC! It makes you wonder what PC stands for! Could it be a 'pricey contract' or 'pretty c#@*' :)

Stay tuned, the Atari saga continues.

Have just started running Magic 4.0 on my Falcon. The problems seems to be when I load up cab I get a dialog box that says "A ERROR OCCURED" I guess my question becomes is what kind of error was it and what could be causing it. Thought it doesn't to effect the operation of CAB. I also get it again when I do a reset (either a cold boot or warm boot)

Has anyone else experienced this error and what was the cause. Thanks for any help that you can give me.

Hi Daniel,

The only problems mine gave me were right at the beginning :-) First, there's a jumper on mine just like Louis describes - if it's closed, the drive just doesn't spin up <frown>.

Second, the IBM drive replaced a _hellaceously_ (sp?) noisy NEC 40MB thing which was part of an Evesham Electronics unit. This had a short SCSI cable in it, which was initially fine with the IBM, then refused to work after I recased things in a mini-tower. Strangely, the NEC drive continued to work fine, but I had to buy a new cable to get the IBM to work <shrug>.

This IBM drive is supposed to be (and seems like it is) self-terminating. I've been meaning to search out tech details on the drive since I came on-line a few months ago - I've just never gotten round to it :->

BTW, the host interface is an ICD AdSCSI ST - real old huh?

Cheerio,
Misha

>newsgroups works fine. But my out going e-mail an't worth Sh*t.

Hi Dennis,

I know this isn't _much_ help, but from the DIAL.SCR:

Your ISP probably imposes a limit to the size of IP packets
(Maximum Transfer Unit). Many ISPs use the standard Ethernet
MTU of 1500 bytes. 576 is safe in any case, however.
#

So at least it shouldn't be too small :-> I don't know enough (like
anything at all) about TCP/IP to suggest anything else...

Good luck,
Misha

I'm selling the following Atari ST/STE/Falcon games:

(here's what's left)

****
Atari ST (Sierra On-Line) games.
All of them are in MINT condition, in the ORIGINAL BOXES with instructions
and any "extras" the games came with.

King's Quest II - Romancing The Throne
The Black Cauldron
Conquests of Camelot - The Search for the Grail
Police Quest 2 - The Vengeance
Mixed-Up Mother Goose
Space Quest 3 - The Pirates of Pestulon

}}} $8.00 each

****
Atari ST (various titles)
None of these have the original box, but DO come with all instructions and any
extras the game came with. Original disks - tested w/ very little use.

Test Drive II (The Duel)
Test Drive II (Super Cars add on disk)
By: Accolade
*INCLUDES: Instruction booklets, copy protection "wheel".
}}} $5.00

Lotus Turbo Challenge 2
By: Gremlin
*INCLUDES: Instruction booklet, secret "passwords" for extended play etc.
}}} $4.00

Championship Wrestling
By: EPYX
*INCLUDES: Instruction booklet
}}} $3.00

Speedball
By: Image Works
*INCLUDES: Instruction booklet
}}} $4.00

****
Please e-mail if interested (remove SPAM-blocking first!).
I'll discuss any offers / multiple purchases - don't hesitate to ask!

All,

I love my 1040ST dearly, but I haven't taken it out of the closet in months, and frankly, I guess I can always buy another one if I need it. :)

I have no idea what it's worth, and I'm sure I'll get abundantly spammed for this, but the best reasonably offer by, say, Dec 3 takes it (assuming the best offer is worth it to me). I can answer questions about it, but may not be able to handle the extra-techie things any more. It's a fairly early model, no composite video, and I upgraded the ROM back in '87 or so so I could stop having to load up floppies all the time. :)

Will also trade for other computer stuff, workstation stuff, or synth stuff. Let me know what you've got!

- Patrick

I do have a suggestion...how about making a Zip file with ALL of them
inside (with the folders intact)They seem to be small enough files
that this would be plausable. It would save a lot of time downloading
them indevidually. Sometimes I forgot which file I was on when I was
downloading them..!!.just downloaded some more..will let you know.

Hey Dana,

Sorry to hear about the PS problem. It will probably be cheaper
to replace it than have it repaired. That is unless you can or
knows somebody that has the ability to repair switching power
supplies. If you do decide to buy a replacement I would suggest
looking to Best electronics for their PS as it is a well built
one. It is alot better than the weak PS's that came in the
Falcon. Anyway good luck

Peter, it *was* a trade fair. At least for 85% of the stands... therefore
I reckon the standholders also brought "old" material to get rid of. Lotsa
drives below the 2 Gb limit were available at low prices and those were
all new (and cheap). One stand had 9" color VGA monitors available at
only 40 USD. One huge pile of 18 feet wide and 6 ft high, all running a
test program. I believe they were Olivetti's. But SIMM's??? Hardly any,
the 4 or 8 Mb types...
I just looked into C't December: compared to last month they went up 25-
30% in price but most firms list very few types, where I saw at least up
to 32 Mb types mentioned plenty in last month's issue. Unless someone has
bought the "World Stock" they are becoming scarse. This brings me to
another Q., do the Milan and Hades accomodate DIMM's?

Hello everybody. I had time to look at Adoom sources (Amiga version of DOOM) which contains a music player. I ported it to my Doom (which becomes v0.80). The other version (v0.06) will get it soon. The music replay is done with 68030 (not the dsp) To listen music, you need the file 'MIDI_Instruments' which is provided around Adoom archives on the net (because I don't know for the moment where it is. I made some other corrections too.

Hi David
Falcon has no Modem 1 port only Mosdem 2 this needs to be
changed in your dial scripts etc.
Use "H S Modem" in Auto folder before Sting i.e.
DRIVIN PRG then
SCC.PRG (Not "MFP.PRG as for Mega STE)
STING

GOOD LUCK! CHARLES

Yep, that appears to be how the program works.

FWIW, Edith appears to be much more stable under MagiC than my previous
attempts under Geneva. I may just have to send to Atari Computing for the
docs.

True and that goes for the app's we use as well!
I've been using Hades since the very beginning. Started with the first
Hades ever delivered from Medusa Computer Systems. At the time it was a
Hades040 which I later upgraded to 060. Since then upgraded with the
faster ROM's and ET6000 GFX-card which is the present config.
I use this and our Hades040 at work with Epson GT-8000 scanner
(Mustek CD6000 and SP12000 earlier), HP6L/5MP/4P LaserJets and an Epson
Color II. SyQuest EZ 230 Flyer as backup unit.
128Mb of RAM and lot of harddrive space (SCSI and IDE).

I use it for several purposes but mostly DTP and database. I also like
try all sorts of applications and most of the time they work like expected.
I'm using MiNT 1.15.1.03/N.AES 1.2/NVDI 5.01/jinnee 1.01 which is
running perfect most of the time.
MiNT has gone through some very exciting development lately and is IMO
more stable than MagiC!
Some small glitches with jinnee but they might be sorted out in the latest
version which I don't have yet. Sometimes I use Thing instead and although
just as good as jinnee not as fancy and that's why I prefer jinnee.

Calamus SL runs like a dream, fast and efficient and so does DA's Layout
for vector editing, PhotoLine for pictures, Papyrus for wordprocessing.
Texel is my choice of spreadsheet and Twist3 my favourite database.
For communications I use STiNG/CAB/MyMail/Newsie/aFTP/CoMa. All works
OK and I can't say they should work any better on another machine.
You all know how it is with computers.

These are the progs I work with daily both professional on Falcons,
a Hades040 and at home on the Hades060. (I have a TT as well but it's
only here as a backup unit if anything breaks.)

I also have to work with PC's and Mac's where I use Illustrator,
Photoshop, Excel and Word for compatibility with our customers work.
If I compare all the systems and the applications I use the choice is
easy. In fact very easy. I would not change my Hades060 against ANY

of the systems I've tried. I don't regret one cent spent on this
wonderful machine. Although rather expensive I find it worth it.

Support: Not much to say. Repairs and upgrades are fast from Medusa
but be prepared to deal with them in the German language. And
remember that freights are expensive.
If you need support in English then go for another dealer.

>My other problem, which is ongoing, is hooking up a Epson scanner to

>actively and not passively. I still have to get to grips with this.

Talked to you about this before. Have you tried another version of
the program yet? I have an English LookII that don't work on any Hades.
I use an older German version with no problems at all. Without
termination as well.

>A minor problem is an odd response on moving the mouse when the
>floppy is being accessed.

Agreed and I'm told this is because the lack of DMA.

>The key-click sounds repeatedly and
>multiple re-reads of the drive occurs when the current operation is
>over. Also the floppy drive seems to rotate all the time when it
>contains a disk. A few times at the beginning the hard drive would
>stop running and then when it was accessed it would re-start. This

Are you running the FPU__3.PRG or the OVFIX.PRG? I get the same
problems when accessing floppy from plain TOS without these TOS patches.

>Occasionally I get a crash using Papyrus and Cab but I got those
>with Papyrus on the TT. The DirecT60 seems to cope fairly well with
>these but occasionally I have to resort to the reset button on the

Same here but Papyrus 5 is more stable than Papyrus 4 and CAB
crashes with certain webpages on all systems.

>front. I think it says in the German docs that the 68060 does not
>like being switched on again within 15 minutes of being switched off
>so I take care not to do this.

It says maximum 5 minutes. This is because of the different voltage on
the system (5V) and the processor (3.3V). These occasions are (at least
from my pointof view) very rare. The only time this happens to me is when
I've got a really nasty Beta version on my system. And I sure don't wait
5 minutes before I restart. ;-)
If, for instance, CAB crashes I can kill the process and start it over
again. (Thank you MiNT)

>I can't think of any other problems apart from the price. It is a

>for the price but I did not consider it then and would not want to
>consider it now.

I agree with you here. I don't regret one cent spent.
I think during the time I've owned Hades, PC owners have updated their systems from 486 to Pentium to MMX to PII so although expensive it's economic in the long run. ;-))

What you should think of before you go ahead is:
Do you have to be 100% compatible with PC or Mac applications?
Do you want to play fancy games on your computer?
Do you have to be able to browse every Java site on the net?
Would you like to play MP3 files?
Would you like your computer to be boring? ;-)

If your answer is NO then go ahead and buy your Hades. I promise you that you'll never regret it!

greetings, janne

AFAIK aFTP comes in two versions. One for MiNTnet and one for STiK/STiNG.
Be sure to use the right one. It's in the "About..." dialog. If you get
that far that is...

greetings, janne

I don't remember for sure, but perhaps Dana will tell you, since he
just ordered one. It seems to me like it was about $90 or so. And
it only cost $5 for shipping COD, which was cool.

Good point. I've tried holding off on buying another desktop,
because I've been waiting for Jinnee. But I might be waiting
forever, so I'll probably register Thing soon. Still, it would be
nice if I had a choice.

Maybe, but I have gotten one "Connecting to host..." that never went
away, even after about an hour. (I was doing other things, so I
didn't mind waiting to see if it would recover.) Still, there does
seem to be fewer delays. And the second try feature is very cool,
because sometimes the request doesn't get processed the first time,
but makes it the second time..

that's what I found too - for one thing, that Edith loads MUCH
faster under MagiC.

also, when using Edith in the past in hi-res colour mode (thanks to
having a Nemesis onboard) I noticed a very discernable lag between
typing in words and having them actually appearing on the screen -
switching to MagiC has cured that for me. And if you're wondering I'm
I'm running Edith in hi-res TrueColour, well that's due to the fact
that my default desktop for my Internet stuff is that mode, and I use
Edith as the editor for NEWsie...

Right, and it needs an AES from v 3.40 upwards. Does the Falcon have that
one? MagiC does.

Too bad their aMail is only for MINTnet... then again, it's not even
publicly available :-(

3600. Latest MagicPC version?

Newsgroup: comp.sys.atari.st
Date: 1998-11-29 00:00:00 UTC
From: <>
Message-ID: <365fffdb.1933790@news.freeserve.co.uk>
Source record: 89111

As I now have a laptop (PC I'm afraid) I would really like to run some of the applications I use on my TT on, and to this end was wondering what the latest MagicPC version.

Now that Magic v6 is available has an equivalent MagicPC version shown its head?

Also how does (in peoples opinions) MagicPC compare in the case of running applications to the other PC based emulators (Gemulator, PacificST, etc).

Thanks.

Spencer

That it is more a question of definition than of arithmetic. As far as
I know (knew), the beginning of the first century and the first
millennium were defined as beginning in the year 1, but from then on
the normal rules of arithmetic apply. That, at least, is how the whole
world has always treated those numbers.

It does run under Tos, I used to use it this way before having Magic.
But Ted, pay attention to use the correct version: there is one for
StiNG and one for MiNTNet.

(Sorry, I have no Nemesis).

aFTP makes good use of the /USER/ configuration method. I bet you have
not set the environment variable for HOME. If you are using Magic then
insert this in your .INF file:

#_ENV HOME=C:\USER

I was told that partitions over 512 bytes/sector couldn't boot, and
therefore the C: partition had to be GEM standard 16 meg or 32 meg 512
bytes/sector.
Was I told wrong, and a BGM partition can boot after all?

The last thing I ordered from Best, the COD was $5.00 I think,
but the shipping itself was another $8.00, altotal, my $29 idem
was almost $40 after UPS added their charges to it.

Yes, Louis, I do this eventually, after I've tried a search with
Selectric (which doesn't always find what I'm after).

>Your listing under b) and c) surprise me... sure it's not being specified
>somewhere?

No, indeed: my preference is N. An example of a file ending up in the
clipboard was Coach95: it took me ages to track it down.

Cheers, Charles.

I do use XBOOT, but I have no specific ASSIGN.SYS file selected. So
the ASSIGN.SYS file written by NVDI should be loaded. It's set up the
same way on the TT, and there it works.

I wasn't suggesting _replacing_ the current setup with one (or two)
complete files. I was suggesting the _addition_ of a complete file
or two. That way a person could easily download the entire
collection, while still having the ability to only grab parts of it.

In the past few months I've ordered the PS, a new mouse and a Falcon
keyboard from Best (three separate shipments). In all three cases I
had them shipped COD, and my *total* shipping cost was $5 each time.
Maybe it's because I live in a neighboring state.

> 221 cello.qnet.com closing connection

The messages that are being sent correctly have the line containing
'Message accepted for delivery'. At least by studying the log you'll
know which ones 'got out'.

On one occasion while using POPwatch I had an outgoing mail that refused
to be sent because the server complained about the "." not being there.
Eventually, after redoing the mail from a backup copy of the body, it
did make it on its way (after multiple attempts). For the life of me,
though, I never did understand what was wrong in the first place,
besides being related to this "." thing (for lack of a better word or
term). And I remember earlier versions of NEWSie having trouble posting
some articles because of the same thing. Again, I never did understand
what was going wrong.

I'm sorry, but though I use DA's Layout with a Stylus (not a Pro though),
I've never had need to adjust my gradation. I simply adjusted the K, and
left it alone.

>Has anyone had problems with NVDI 5 and their Hades 060? Specifically,
>I can't get the printer configure cpx to work at all. Same set of
>disks work fine on my TT.

I had a problem initially, which was because I use a boot manager with the chosen Assign Sys file in a folder and not on the root of the C drive. This meant that the Assign Sys written when I installed NVDI 5 was ignored on boot-up and then overwritten. I only had to copy the correct Assign Sys into the folder and all was well. There is also some information in the manual with NVDI about what should be in the Assign Sys file, which can be edited manually if needed.

Hope this helps,

Paul

I can't say too much about this at the moment, but maybe Martin (or others) you. However, I would expect that with the ATI MACH card you would get all you need.

>What strikes me is the mentioning of Medusa not
>giving much support. Well, would they on the Medusa then?

Your guess is as good as mine ! It may just be a temporary problem with their E-mail address right now, but other users have said that they are not that helpful. Even so, the machines are still good, and if speed and/or memory is what you are after, I would be surprised if the Hades can yet be bettered.

>A shame really... a friend of mine ran an STe on an ET-4000 several years
>ago in 15, 16-bit and perhaps 24-bit too...

I suspect we will solve the ET4000 problem eventually. I am sure it is only down to the driver software. However, it only has 2meg on board, whereas the ATI MACH has 4.

Cheers

Paul

|your impressions.

No machine is perfect but I have been using a DirecT60 for about 9 months and have had no *major* problems. The DirecT60 is really a Hades - I bought a Hades motherboard with 68060, 64 mb of memory, ATi Mach 64 video card with 4 mb of VRAM, 2.1 gb ide hard drive, hd floppy and Yamaha CDR and stuck them in a case from Maplins. I bought the best pc compatible keyboard that PC World had in stock (an IBM) as I use the machine almost exclusively for typing. The only problem was when I was inserting the board an oscillator came out of its socket and I put it back the wrong way round. Nothing happened when I switched on until I realised my mistake.

If you are buying the machine complete you will not have to worry about putting it in a case but if I knew then what I know now I would have looked for a better case. Problems arose from conductive support pillars and an absence of adaptors to accomodate 3.5" drives in 5.25" slots. I had to buy some metal ones elsewhere and file them down to size.

I am using a high resolution monochrome 21" Eizo Flexscan at 1280 by 960 at 256 colours and that is where my main problem lay. I would like the machine to know that I have only 2 colours, black and white, but I cannot get it to accept this at the resolution that I want. It's not a major problem now but I had some difficulty with trying to display a colour resource file output in mono.

My other problem, which is ongoing, is hooking up a Epson scanner to the SCSI port. It does not work properly and the firm that sold it to me does not seem to want to know. The scanner works fine with my TT. Medusa, who make the Hades board, kindly sent me a text in German. I think it is saying that I should terminate the cable actively and not passively. I still have to get to grips with this.

A minor problem is an odd response on moving the mouse when the floppy is being accessed. The key-click sounds repeatedly and multiple re-reads of the drive occurs when the current operation is over. Also the floppy drive seems to rotate all the time when it contains a disk. A few times at the beginning the hard drive would stop running and then when it was accessed it would re-start. This

seemed to be very sporadic.

Occasionally I get a crash using Papyrus and Cab but I got those with Papyrus on the TT. The DirecT60 seems to cope fairly well with these but occasionally I have to resort to the reset button on the front. I think it says in the German docs that the 68060 does not like being switched on again within 15 minutes of being switched off so I take care not to do this.

It is *most* important that you have the caches on as much as possible. The speed of the machine is really related to these. I once had a large document (120 pages or so) and I compared the TT and the DirecT60 by replacing 6 or 7 thousand characters. With the cache off there was no difference in time (14 minutes I think). With the cashe on that time came down to 4 minutes (I think).

I can't think of any other problems apart from the price. It is a heavy investment and I suppose you could nearly get 2 Pentium IIs for the price but I did not consider it then and would not want to consider it now.

John Logan

: crashed. I had it packed with all kinds of ST and STe stuff, just the
: way I liked it. Damned. Anyone have a drive they can sell me to replace
: it?

Just a thought. Whenever I had a drive quit, I just turned it upside down,
changing the load on the spindle bearings, which are usually the problem,
and made a backup copy to copy onto the next hard drive. That has worked three
times so far.

You lucky thing :-) I had to go to the local park to see _anything_
(too much light pollution otherwise), and even then it was hazy. The
peak was totally fogged out :-< But the few I saw were tops :-)

> Yesterday I sent out only about 5 e-mails, 3 of them got to were

Hi Satcom2,

If I recall correctly, you have recently moved to the Seattle area, where I and a few other Atarians reside. For cheapo HDs, try "Computer Renesance". They are a mainly used computer store, and have several branches in the Puget Sound area. Also, try CompuCare. They sell refurbushed and new drives for quite low prices. I think they also have a few stores. One of them is in North Seattle (near Sears), conveniently near me. ;-) I got a Toshiba 1.08 gig 2-1/2" IDE drive to replace the stock 85meg Quantum. The store I got it from is gone, but I think CompuCare sells those models too.

Oh, ditto all of the above for SCSI drives too.

Good luck,

Clayton Murray

I've looked there, like the FAQ file going out, it said it was
sent out, but I noticed that the copy that went to me, it had
opened to somekind of a server, I'll have to do it again and post
what it says.

Hi,

And even if yer ftp client can get more than one thing at once - I've
noticed aFTP didn't 'get up to speed' with all those little files when
I d/l'ed them around 4am today. At least, not up to the sort of speed
a single 900K file would have come in at at that sort of time...

So that's my vote too :-)

3640. Is my atari toasted?

Newsgroup: comp.sys.atari.st
Date: 1998-11-29 00:00:00 UTC
From: John Teffer <jdteffer@wcf.net>
Message-ID: <3660F931.5C22DFC5@wcf.net>
Source record: 89161

I just picked up an old 520 ST FM, I 've never had any experience with ataris other than the 2600, so I did'nt know what to expect. I hooked it to my tv and turned it on, and got a white screen. The drive light blinked on and off and I could hear the stepper motor moving a little bit. I threw in a random floppy and tried turning it on again, this time I got a nice little desktop. I figured out how to move the cursor, and got It up to the menu, and as soon as it got there the screen went white again, this time with a bee and two bombs. Since then I havent gotten It to do anything but give me the bee and bombs.

Any suggestions?

>N.AES 1.2, Thing or jinnee)

The problem was that the first release of the 1.15.1-0.3 returned lots of
debug messages to the console. This was very annoying especially when I
was online. To avoid that I added a line like this "DEBUG_LEVEL=1" in my
mint.cnf. The messages were gone now but I couldn't use Phoenix 5
(database) anymore.
Anyway I use the newer 1.15.1-0.3 kernel now without any problem.

Yes, good tip. You can often keep it going long enough to make the
back up.

Yes, the clue here is that it is an 'old' ST and has probably had some
bad treatment in its life.

There are some socketed chips on the PCB which can work loose and give
these sorts of bus error.

You will have to remove the top of the case, then the shielding. Press
home all the socketed chips you can see and clear out any dust,
detritus which has accumulated. Check the plugged connectors to the
floppy - these can work loose, too.

You should be back in business then.

> You know what I do still miss from Neodesk/Geneva though? I miss that

Well, if you are multitasking, why not just install Neodesk as well, so you get the best of both worlds. I can have 3 desktops running at once in conjunction with Geneva.

AM.

I think therefore I AM.

3651. FS [UK]: Outer shell for STe

Newsgroup: comp.sys.atari.st
Date: 1998-11-29 00:00:00 UTC
From: denesh@cyberstrider.org
Message-ID: <366155dc.16762843@news.demon.co.uk>
Source record: 89172
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Anyone interested in buying a 1040-STe Outer shell from me? I sold the internals inside a case and now have the outside plastic sheel (along with the inner metal casing) left.

Make me an offer and it is yours - offer is subject to postage and packing on top.

Regards
Danny

Hi All,

Sorry for so long delay. I made this offer for Maciek Rozmus who is
Pole as I am -I was surprised he complained on c.s.a.s instead asking
me.
Because my English is poor, I expected someone English-speaking can
make this list for you. Nobody did, so I must do it.

This list is very simplified and describes how to install Okami for use
with POPwatch and NEWSwatch.

1) Get the Okami archive.
2) Uncompress archive and save on your HDD.
3) Somewhere on your HDD (a partition where you keep your
data is a good place), create a directory for a database - let's name
this folder O (like Okami).
4) Inside this folder create next 3 subdirectories:
/O/MAIL #it's for incoming mail
/O/NEWS #it's for incoming news and the database itself
/O/MQUEUE #it's for outgoing mails and news

If you are using Okami v. 1.35 or lower, you must create an empty file
SEQUENCE.SEQ inside directory /O/MQUEUE/.
Okami 2.0 creates this file itself.
5) In first attempt the only configuration file you have to edit
is O.INF. The others you can edit later, when you want to tune up Okami
to your needs.

When editing, you need to adjust *ONLY* the variables marked:

NOS: yes
or
NOS: optional
The others you can ignore.

In O.INF file you need to enter your logname and realneme, mode=NOS,
paths to the directories created in item 4), paths and names of the
rest of configuration (*.INF) files and a text editor, and some other
variables. Every variable has a detailed description in O.INF file.
On a single user systems you needn't to create a PASSWD file.
6) Configure POPwatch. You have to set mode=NOS and paths to
directories: MAIL and MQUEUE.
7) Configure NEWSwatch. You have to set mode=NOS and paths to
directories: NEWS and MQUEUE.
8) On your desktop install icons of DIALER, POPWATCH, NEWSWATCH
and OKAMI.

That's all!

When retrieving, POPwatch saves retrieved mail as USERNAME.TXT in
O/MAIL directory, NEWSwatch saves news as BATCH.TXT in O/NEWS directory.

I hope it helps.

--
Greetings from Okami Newsreader user.

If there's ever a next time, when you reach the point where you change
the first char to E5 and have saved it back to disk, perform a reboot.
Now run a tool to recover lost clusters.

> But after doing this hundreds of files on the same drive
> became corrupt and could then only take the above action.

That duff file was probably crosslinked in the FAT with valid files or
was simply an erroneous "link to nowhere". Recovering lost clusters
above can sometimes restore entries to their correct owner.

> Back up and running now and everything normal. Thanks again
> to all who contributed to the problem.
> REGARDS Bill

I've only just caught this thread. Most likely cause is the 40 folder
bug. Increase your folder memory to be safe. Good job you had a
backup. It's by far the best way to recover from this bug!

Hi Kev, you don't have to live without Groups with Jinnee... :-)

Create a directory with appropriate name, press CTL and ALT and drag the
file(s) you want in the group to the dir. Hey Presto! and you've got
another symbolic link.

From: tparrett@fast.co.za
Message-ID: <912359466.456144@news.netactive.co.za>
Source record: 89184

Reading about aFTP in issue 11 of Atari Comupting I downloaded it
for a trial. Unfortunately I could not get it to run. I first tried it
with my normal set up which is TOS, single tasking and Nemesis on high
setting. No luck, it simply gave me two bombs when I tried to open it.
I next tried it with the Ease replacement desktop installed. Same
result.
Then as a last resort I tried it with MagiC running. No bombs this
time but the programme just hangs and the only way out is a reboot.
In case my original download was faulty I grabbed another copy but got
exactly the same result.
My system is a Falcon with 14Mb Ram running Nemesis.
Anyone with similar results or better still a solution ?
thanks

Let me defend myself and other English-speaking participants of this group
by saying that speaking English is only a small part of the requirements
for writing *useful* instructions. You made a nice first cut. I would
certainly be willing to attempt to answer any specific questions.

No argument there. The nice thing about NeoDesk is that it had "everything" neatly integrated. Now, there are alternatives, you just have to find them *and* work your way through the non-existent English docs.

> PS BTW, what did you finally use for your default printing? Add that to
> the list of things I miss, drag 'n dropping text files to the printer

That I managed to replace using Thing's printer ICON and MagiC's PRINT.TTP program. Works, here, just like NeoDesk's built in function.

I have this strong, personal desire to use what is *available now* and
supported and not wait for something better to come along. Thing meets
this definition, Jinnee doesn't.

In this instance, FUD may be too strong a word, but there is no indication
that an English version of Jinnee is anywhere close to being available
here in the US. That being the case, why should I wait?

Unfortunately, although NeoDesk works with MagiC, it doesn't work well
IMO. It obviously was optimized for use with Geneva.

well, that's the reason I switched from Neodesk4 to Thing - mainly,
in my recent switch to MagiC as my operating system, I found that
Neodesk would NOT run satisfactorarily as MagiC's desktop -
particularly when it was time to shut down, Neodesk would unload, then
load itself back in, MagiC would attempt to shut it down again, and the
whole thing wound up going into an endless loop unless I shut the
computer off or did a warm boot.

If anyone knows how to make Neodesk behave properly under MagiC I
would really like to hear it.

Thing, however, I was so taken with that I registered it
immediately through Interactive - it really is that good. I've recently
sent in a Thing Power Users article for TAF's Phoenix newsletter
talking about its features, particularly its AV server functions...

3672. "Running" problem

Newsgroup: comp.sys.atari.st
Date: 1998-11-29 00:00:00 UTC
From: jfhaslam@zetnet.co.uk
Message-ID: <73s06r$1tp$1@irk.zetnet.co.uk>
Source record: 89193

Hi All!

I've got the full version of "Running" for my Falcon (14mb RAM, IDE
and SCSI hard disks, no Nemesis).

The problem is that the program doesn't save the game. This used to
work with the shareware version.

I'd thought that perhaps I'd run out of hard disk space, but a quick
check revealed over 55mb free in that partition.

Anyone else had this problem?

Cheers!

James

hi David,

you may wish to consider maybe upgrading to the latest English
version of MagiC, 5.11 - although MagiC 4 was touted as the first
Falcon-compatible version of MagiC, from what I've heard from a fellow
Falcon owner who has tried running version 4 it has a few serious
problems.

Systems For Tomorrow, BTW, handles MagiC and other ASH products,
and offers a fairly reasonable upgrade path from version 4 to 5.

The only thing I have to complain about MagiC 5 is that I can't
print under NVDI in higher resolution modes (which my fellow Falcon
owners have not had the same problem). According to ASH, it's a
"hardware problem".....

Hi Dennis,

Newsie doesn't delete the log. After you quit Newsie, it should be in Newsie's working directory. It's called... LOG. If you want to keep it, you need to save it under another name, or rename it, or move it to a different directory, or copy it to another partition, or anything else like that. When Newsie starts up again, it WILL start a new LOG file, erasing the previous one (in the working directory).

After you send a posting (or email), look at "VIEW LOG FILE" from within Newsie. It's under the "SPECIAL" menu. It will usually show if the item actually did get sent, or if not, it will (usually) say why - or give some sort of comment. The automatic dialog box in Newsie doesn't give much info, so the LOG can be very helpful with problem solving.

Hope that helps,

(What does "Slc." stand for??)

Hi All,

Sorry for so long delay. I made this offer for Maciek Rozmus who is
Pole as I am -I was surprised he complained on c.s.a.s instead asking
me.
Because my English is poor, I expected someone English-speaking can
make this list for you. Nobody did, so I must do it.

This list is very simplified and describes how to install Okami for use
with POPwatch and NEWSwatch.

1) Get the Okami archive.
2) Uncompress archive and save on your HDD.
3) Somewhere on your HDD (a partition where you keep your
data is a good place), create a directory for a database - let's name
this folder O (like Okami).
4) Inside this folder create next 3 subdirectories:
/O/MAIL #it's for incoming mail
/O/NEWS #it's for incoming news and the database itself
/O/MQUEUE #it's for outgoing mails and news

If you are using Okami v. 1.35 or lower, you must create an empty file
SEQUENCE.SEQ inside directory /O/MQUEUE/.
Okami 2.0 creates this file itself.
5) In first attempt the only configuration file you have to edit
is O.INF. The others you can edit later, when you want to tune up Okami
to your needs.

When editing, you need to adjust *ONLY* the variables marked:

NOS: yes
or
NOS: optional
The others you can ignore.

In O.INF file you need to enter your logname and realneme, mode=NOS,
paths to the directories created in item 4), paths and names of the
rest of configuration (*.INF) files and a text editor, and some other
variables. Every variable has a detailed description in O.INF file.
On a single user systems you needn't to create a PASSWD file.
6) Configure POPwatch. You have to set mode=NOS and paths to
directories: MAIL and MQUEUE.
7) Configure NEWSwatch. You have to set mode=NOS and paths to
directories: NEWS and MQUEUE.
8) On your desktop install icons of DIALER, POPWATCH, NEWSWATCH
and OKAMI.

That's all!

When retrieving, POPwatch saves retrieved mail as USERNAME.TXT in
O/MAIL directory, POPwatch saves news as BATCH.TXT in O/NEWS directory.

I hope it helps.

Hi,

well, come to think of it: check the header lines please. See to it that
they're not broken by the editor when writing them. I know I had troubles
with QED set to wrapping at 75 chars, but I forgot to set it to NOT WRAP
existing text. Newsie sends the header lines to the editor as well (I know
Peter already suggested to John ages ago to change this) so if your editor
is not properly configured, it messes with these. Result: msg not going
into the system!
Just another thought...

I also have this problem, but, only when I boot up in ST High mode
with no other programs, accessories running. This is rather
annoying but as I so very rarely use ST High this is not a problem
for me.

> Also the floppy drive seems to rotate all the time when it
> contains a disk. A few times at the beginning the hard drive would
> stop running and then when it was accessed it would re-start. This
> seemed to be very sporadic.

Hmmm, this I do not get. Medusa have updated TOS recently and you
can now buy replacement TOS ROMS for your Hades. I don't know if these
two problems you have mentioned have been fixed but I do know that
some problems with the floppy drive (such as compatibility) have been
improved.

> Occasionally I get a crash using Papyrus and Cab but I got those

> so I take care not to do this.

Yes, if I get a nasty crash I have to leave my machine off for at
least five minutes before it will re-boot correctly, but this is
a rare occurrance for me.

> I can't think of any other problems apart from the price. It is a

Yes, that thought crossed my mind as well. But, I think I would rather
have my Hades than two Pentium PC's :-)

Hi!

Some days ago I bought myself a CD-rom drive. I wanted to use it
with my Milan, so I connected it, as a slave, on the same cable as my
IDE harddisk. But so far I haven't been able to get it working.
When I start my computer, HDDriver (7.55) recognises the drive on IDE
1.0 as a CD-rom drive, but cannot read the drive information
correctly from the hardware. Metados/Spin gives a message that the
drive won't answer.
When I get to the Thing desktop, and use 'Mount Devices', I get one
icon as configuerd in Spin (cd-drive O) and one new icon from
HDdriver (cd-drive G). Clicking 'O' I get a empty window...clicking
'G' I get activity at the CDrom drive and a warning like 'Drive G
does not respond'.
The drive does respond to instructions like eject, park and play
(audio cd). I have tried all configurations I could think off. All
posible jumper settings on the drive (master, slave, cable select),
but can get it to work. Why? What am I doing wrong? Is the drive
broke? Please HELP!

a desperate

You can download the latest version of Notator - including the fonts - from
Hallvard's brilliant site:

http://members.forfree.at/~notator/

At the same place you can join the Notator mailing list, full of helpful
people - recommended.

What model of CD-ROM drive have you ? As I tested, older Atapi drives
work not OK with mentioned software. Perhaps is problem that drive not works
OK as slave with your hard disk. Try put it as secondary master (as I know
Milan has 2 IDE ports).

3686. Mac to Atari Transfers

Newsgroup: comp.sys.atari.st
Date: 1998-11-30 00:00:00 UTC
From: Mark Simpson <marksimp@integrityonline7.com>
Message-ID: <3662B599.879BE16F@integrityonline7.com>
Source record: 89053

Hi,

I have an 8100/80Av Power Mac. I hooked up a syquest EZ135 to it's external SCSI bus, and have been successful at mounting, initializing, reading, & writing to carts that were previously used for atari. I'm trying to transfer files from my mac to the EZ flyer I have attached to my falcon so that I can archive mac data onto CD via a CD recorder I also have attached to the falcon.

I can't get the falcon (running Magic 4.0, NVDI 4, Ease 4, HD Driver 4.51) to see the mac initialized EZ 135 carts. I have tried to initialize the carts using mac OS, mac OS extended, and pro DOS, initializing schemes, but none are seen by the atari. When I try to initialize the carts using ProDOS on the Mac, the initialization fails (Ive tried it using 4,5,6,7, &8 partitions), so I'm not sure EZ 135 carts can even be initialized this way.

I have been successful at initializing the ez 135 carts in mac OS and Mac OS extended formats, (1 large partition in both cases), and then writing/reading the disk on the Mac.

Has anybody had experience with this, and can direct me along the path to success?

Thanks,
Mark Simpson

Anyone else having problems with the new Aniplay, version 2.04? I can't get it to play most of my .WAV files without an "Abnormal Ending" error message. These are usually 16-bit/25 khz stereo samples that I recorded direct from CD using Alexander Clauses' CD-Player. They run about 10-15 seconds (normally) and are around 1.2-1.5 megs in size. All my other .WAV players work on them, including the old Aniplayer, version 2.02. Thanks.

PS RealAudio does work! ;-)

3690. HP LaserJet edge enhancement

Newsgroup: comp.sys.atari.st
Date: 1998-11-30 00:00:00 UTC
From: jlog@zetnet.co.uk
Message-ID: <73ujdq$4u1$2@irk.zetnet.co.uk>
Source record: 89057

I wonder if anyone knows what the PCL5 command is for turning
edge enhancement on. (HP call it Resolution Enhancement Technology.)
I am using Papyrus to drive a 600 dpi LaserJet 6 in 300 dpi mode.
This is to save time when printing. The output is not as good as
when a 300 dpi printer (such as a HP LJ4L) is used leading me to
suspect that edge enhancement has been turned off. If I knew the
command to turn it off and on I could modify one of the drivers.

Hey thanks for your help. I am really not that impressed with
Magic! and probably will go back to running Gevena instead.

> >I can retreive email through Earthlink from my old ISP just fine.
> >
> >Any suggestions?

I had the same problem, earthlink support kept emailing me a list of access

numbers, but would not say why.

Then I tried them and found that one number (PSINet) worked fine and the

other(s) (Worldcom) did not !?!

I am lucky that I have the choice, it seems that the different POP's have

different gateways.

Test a another number in your area before you start trying to tweek the
mailer,

I upgraded mine, I changed settings, and drove the (Mailer) tech support crazy

before I discovered the difference between POP's!

cheers,

RDL

What gets me is, some mail gets out just fine, one e-mail will
get to were it's going, yet the very next message going to either
another address or even the same one will NOT get there! That's
what bugs me the most. I could live with the delay (would also
hate it at the same time), but its the mail not getting to the
address that I hate themost. I've sent 5 e-mails to myself since
yesterday afternoon, not one of them has come back to me.

Well it's worked ok there, my C: drive is my internets drive, all
programs for the 'Net' are on it.

>The messages that are being sent correctly have the line containing
>'Message accepted for delivery'. At least by studying the log you'll
>know which ones 'got out'.

That's the odd part, NEWSie says ALL of the messages have gone
out, yet I know for sure there's been ones that go nowhere.

I might have to call the tech support of my ISP and ask some
questions.

I used a stop watch and a posting via e-mail will take between
32 to 36 seconds to get sent out.

Well it's a nameless CD-rom drive, made by Lite-On Technology
Corporation, model LTN-204. Manufactured September 1997...
About that other IDE port....I will try that as soon as I can get
another cable. Thanks!

I don't know about "ProDOS," but I have had excellent luck
transferring back and forth via standard DOS formatted jaz disks
and using PC exchange on the Mac and Bigdos 6 on the Falcon.
Bigdos 6 is available at all of the usual places..

Yes, quite right. A CD Rom should ALWAYS be secondary master on IDE.
It causes no-end of troubles if you link one as a slave on the same
cable as your HD. Change the jumper to Master, put it onto the spare
IDE cable, and it'll work.

Dennis,

I'm not sure whether or not this might cause the problem, the only thing
you can do is check Newsie when writing/editing msgs. Check the header
lines especially. In case they turn up broken, you know it will go wrong.
Afterwards you may check the OUT dir/files, but if that's all OK I
suspect your ISP is playing up...
Sorry I can't come up with anything more concrete...

From: tom.derrick@acpu.com
Message-ID: <912447401@acpu.com>
Source record: 89070

Hi, everybody.

Can anybody point me to information on how to connect a 5.25
floppy drive to the external (drive B) port? And does anyone know
whether it is possible to change drive B from a 3.5 drive to a 5.25
drive by connecting both and switching power to one or the other, or
some other simple switching arrangement?

Hi, everybody.

I now have my floptical (21Meg) drive working but... IIRC, the advertisements for this unit claimed that it could read and write 720k and 1.4m 'ordinary' floppies. So far, it won't read or write to one unless it is formatted with a hard disk formatter (ICD Pro) - and then it is no longer useable with an 'ordinary' floppy drive. Can somebody tell me what I am doing wrong, or were those advertisements just a little bit misleading?

As to the search problem try Parafin.prg, you can either search one
partition or all and it makes use of wildcards as well. For example
mag*.* would bring up every .prg .acc .inf. .txt etc. etc. Tt's very
fast, accurate and reliable.

From: nameerf@flash.net
Message-ID: <73v5v8$ce7$1@excalibur.flash.net>
Source record: 89077

Hello!

My University offers two ways to get your grades. One is by phone, which is many times busy, and two is by computer, requiring authentication. The page says that you will be shown a number, and you need to enter your student I.D. followed by that number, and then you will be asked for a PIN number (like a personal code each student gets). When I access it through CAB, however, I get something like this: "Document protected! Please enter password:" in a separate little window for both times. On computers at school using Netscape, you actually get a similar window which contains a more specific question, and includes the number you're supposed to enter with the student I.D. etc. So in CAB, I can't get my grades via computer because it appears CAB has it's own unchangable message instead of one defined by the computer at the other end (i.e. it doesn't give me the number I'm supposed to enter). Is there a way around this?

I have received the fonts from another person, but thank you for replying.

I downloaded SL321.ZIP from Hallvard, and the only fonts in it were CHORD
and SYMBOL fonts, not the standard fonts I needed. I have mentioned this
to Hallvard.

And I joined the Notator list.

Thanks.

Dave Burns

Hi Mark,
Pro DOS is the only selection I'm offered apart from MOC OS and MAC OS extended. This is using the "Drive Setup" Utiltiy application that came as part of Mac OS 8.1. And to use the ProDOS feature at all, I must select at least 5 (maybe 4) partitions, anything less and the ProDOS selection is greyed out. How big is/are the partition(s) you are using with the JAZ, and what are you using to partition/initialize it? Perhaps this is only a problem with the EZ135.

Thanks,
Mark Simpson

Format it on the Atari first with an MSDOS filesystem, or on a PC
somewhere. Then both the Atari and Mac will read/write it with the
appropriate software (mentioned earlier in the thread).

I doubt that this will help much, but... Atom Smasher, written for the ST in the dim past, runs /almost/ perfectly on the TT. (It is left as an exercise for the student to find the glitch in the program that adds that 'almost' above.) It changes res, runs at the same speed as it does on an ST, and exits smoothly. I can even use ImageCopy's screenshot feature (alt help) to grab full or part screens (I have screenshots for all 32 levels). I use no compatibility software - just run it from the desktop. I don't know whether it works as well on the Falcon.

So it /can/ be done.

ProDOS is intended for the Apple II -- don't use it. And your Falcon won't be able to read standard 'MacOS' HFS-formatted media (floppies, Zips and Syquests) unless you're using MacSee. I can say that MacSee works fine on my TT for reading HFS-formatted Zip and floppy disks. Using it to write to HFS-formatted Zips has been problematic, though. But MacSee is more of a 'curio' these days, although it's still available commercially.

Your best bet would be to update HDDriver. Since version 7.12, it can partition your media using a special 'TOS/DOS' scheme. Your Mac will have no problem accessing these (the same applies to HDDriver's normal 'DOS' partitioning, of course).

Your other choice is to install BigDOS, which worked great -- before buying HDDriver -- for accessing Zip disks from Win95. But since, at the moment, you can't partition the Syquests as DOS on the Mac so that the Falcon can access them using BigDOS, you'll have to partition them on a PC first or find Mac-specific software for doing this. Unless there's a way to partition them as DOS on your Falcon, but I think that would require a complete set of hard disk tools (like HDDriver or ICD Pro). Does HDDriver 4.51 support DOS partitioning?

Hi Mark, Sax here. Hows it going?

The way I've been transfering files is with MagC Mac with my Syjet in 3 500meg
partitions. From what I know, upgrading to HDDriver ver 7.55 will work
with your carts PC formatted.

Hello Fellow Atarians,

I'm working on a new gobble game called SCAMPY it is different from PacMan in several ways. There is a concern that I have in bringing this freeware title to the ST world. It is almost complete except that I need to create between 50 and 100 levels. Here is the concern.

It was written on an ST running at 8mhz. So, it will run on stock STs, STes. I know that most excelerators have a switch to bring the system down to 8mhz again for total compatability. My question is that on systems which run faster than 8mhz without excelerators, is it generally ok to use compatability software to run the games written for old STs, or do I need to add a speed control to the game? How much of an issue is this?

Hi Charles and Louis,

I just recently reinstalled things, and I was using SDCAB to save
binaries where I want 'em, but now realise I don't need to (a hangover
from using CAB 1.5) :-)

For some reason CAB 2.7 (demo) was bringing up the file selector to
save binaries, pointing at drive D: (not where CAB lives, or anything
relevant at all <g>). After a couple of times with this happening, and
me pointing the selector to where I wanted stuff - H:\FTP\ - I 'Saved
Options' afterwards, and it's remembered it since... :-)

So, have I missed anything in the thread about doing this?

>Cheers, Charles.

HTH :-)

Cheerio,
Mish

There is a program called STUDIO 24 from Musilog (France)(not Pro 24
from Stienberg!) That can generate harmonies from a melody line. It is
kinda interesting .There is a track for Chord generation and then from
that it generates the harmonies of the melody. I was able to do a few
interesting tunes with it. B&C computer vision has it for $10.00!
http://www.myatari.com

Also I beleive Dr T's Omega II can do some of that stuff with the PVG
(programable variation Generator.)

Band in a box is for generating Chords to a style of music which you
can put in a melody.

Hope this helps!

3733. More ISP troubles

Newsgroup: comp.sys.atari.st
Date: 1998-11-30 00:00:00 UTC
From: warpstar@owc.net
Message-ID: <73tdji$f28$1@birch.prod.itd.earthlink.net>
Source record: 89143

Need some advice.

Hooked up with Earthlink a few days ago, and am using STing.

Browising the web with Cab 2.5 works ok. I posted this from
Earthlink. But, email does not work. Newsie tries to retrieive my
emails, and gets as far as telling me that I have 3 new messages.
But, it does not retreive the messages, perhaps the mail server
is not sending the packets. The screen sits there and says 0 bytes
received, and sits there and then goes onto trying to retrieve the
second message, and the third. Finally, it opens the Inbox window
and there are 3 new messages of 0 byte length in there at the bottom.
I can retreive email through Earthlink from my old ISP just fine.

Any suggestions?

And the polite tech support men at Earthlink are all stumped on this
one.

Hi Paul,
I've got a similar problem with trying to use
Calligrapher, and NVDI 5. They both want their ASSIGN.SYS files in C root
and its causing chaos while they both overwrite each others files. Like
you I've tried putting these files in a folder, with a pointer to them in
XBOOT. Calligrapher can't handle this at all, and at first NVDI 5 seemed to
load, but now thats objecting as well.

There is an option in Calligrapher when installing it to the
hard drive, to make it load using a floppy disk, so I might have to
reinstall it and use this option. However if I could sort NVDI out like you
this wouldn't be necessary. Am I missing something?

Cheers

>Am I missing something?

Hi Mike,

Maybe, I'm not really very expert at this, it was probably just luck
that made mine work O.K. !

I have got two different Assign.Sys files in a folder on my C drive. One
is called Assign.Sys and the other Assign.Cub (as this is the one I use
when I run Cubase). During booting, something (presumably NVDI) takes
the chosen Assign.Sys file as directed by XBoot and puts it on the root
of C, renaming it if necessary. I would have thought the same idea would
work for you but I don't know Calligrapher or its requirements.

Sorry I can't help more,

Cheers

Paul

>Geneva-Newsie to avoid this problem?

Although I no longer use NEWSie nor Geneva, I did for over a year and
never saw this specific problem. I did all of my reading offline.

Have you checked your drives for any corruption? This does occur for most
users and the results are unpredictable.

After reading messages, I just deleted everything inside the associated
folder manually. It was a whole bunch easier than manually deleting
messages one-at-a-time.

You have the latest version. I just loaded it and it runs fine in a quick
test on this TT.

Have you checked your drives for any corruption?

The Printer CPX *should* allow you to select your page size.

Thank-you, Alfred! This is the first reasonable reason I have heard for
not including a printer driver tool with this release of NVDI. I wish the
documentation had so indicated and then at least all this confusion could
have been avoided.

This I believe because I have personally encountered it myself. :(

Thanks,

Pat

The problem is that any tool which allows one to make/modify a driver also
allows one to access the "proprietary" printer codes. I suppose a work-
around would have been a mechanism to lock supplied proprietary drivers
while allowing one to modify nonproprietary and create new drivers.

3741. getting RealAudio to work with ANIPlayer

Newsgroup: comp.sys.atari.st
Date: 1998-12-01 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <3664b89f.0@nemo.idirect.com>
Source record: 88951

okay, so I've downloaded ANIplayer 2.04 and I've set it up CAB to
recognize incoming RealAudio files and pass them to ANIPlayer.

I've even found a couple of sites to get 14.4 RA access.

But when I try to link up with the RealAudio file, I get a message
"file not recognized".

Anyone know what I'm doing wrong, or need to set up, or a site
where they've successfully downloaded and listened to an RA file?

I REALLY want to try this......

Thanks. The FAQ looks really good. I haven't read it all yet because I only have one phone line and my parents are paranoid that someone's going too call. They think I'm pretty messed up to be learning about computers (just a passing fad) when I could be out smoking crack and having unprotected sex. Anyway, I know it's only a few pages of html, but has anybody thought of making a nice downloadable version, in some sort of portable format like .pdf of something? Just a thought, sorry if there is one already and I missed it.

Thanks again,

John

Hi Dennis

Not sure *why* you posted the whole of your log to a non binary newsgroup, but there you go. ;-) As Pascal said earlier, lucky for NEWSwatch's kill processing ;-)

I strongly suspect your problem is with NEWSie, and not your SMTP server. NEWSie doesn't seem to report such failures very well.

That's the POP3 conversation completed OK!

>-> helo [127.0.0.1 ]
>220 cello.qnet.com ESMTP Sendmail 8.8.5/8.8.5; Sat, 28 Nov 1998 21:09:56 -0800 (PST)

^^^This is where your problem IS!
NEWSie should *not* be sending it's HELO greating until *after* it has
received the 220 cello...... response. As you can see it is sending it
*before*. Which then throws all commands and responses out of synch.

>-> mail from:<starlord@qnet.com>
>250 cello.qnet.com Hello k56-lanc-00-17.ca.qnet.com [207.155.34.197], pleased to meet you

^^^ This is actually the servers reply to the HELO command.

>-> rcpt to:<starlord@qnet.com>
>250 <starlord@qnet.com>... Sender ok

^^^ This is the response to the MAIL FROM: command

>-> data
>250 <starlord@qnet.com>... Recipient ok

^^^ This is the response to the RCPT TO: command.

>-> quit
>354 Enter mail, end with "." on a line by itself

Oh oh. NEWSie has sent a QUIT command. It has *not* sent any actual email
data.

And so on, for the rest of your emails.

Snipped loads more irrelevant rubbish.

Hope this helps explain what the problem is. How to fix it is anyones guess.
Upgrade your version of NEWSie, or replace it with something else instead.

Gary

It appears they have filed for Chapter 11 and ceased operations. Theres companys claiming on E-bay's web auction,s they've purchased numerious drives from the company for resale. Think this is the end of Syquest.. Sorry to say. Own alot of there products, all great except for there latest invention, the SparQ which was built so cheaply, it failed numerious times on everyone who got one it sounds like. I had one for about 6 months, the drive failed twice and the cartridges once. Got tired of loosing Gig's of Downloads so got rid of the SparQ and kept my (2) 230's, (2) 135's, (2) 88 megs, (6) 44 megs all of which are great products.

For Sale (USA) -- Atari Corp. Software Packages

Just came across three unsold Atari software packages that were burried in the back room. If anyone would like them, you can have whichever ones you'd like for $5 each, plus postage (add $3 for Priority Mail postage):

- Atari MultiTOS (includes original Hard Drive installation disk and Quickstart User's Guide).

- AtariWorks (includes 2 original program disks, User's Manual, and Quick Reference Card).

- Atari Falcon030 Software Bundle (includes original program disk containing Audio Fun Machine, Falcon-D2D Recorder, System Audio Manager, Breakout and Landmine; plus Owner's Manual).

Please respond in Email to:

ProDOS is the operating system of the Apple II series (8 bit). It's of
no use if you don't own such a machine (Apple II, II+, IIe and so on).

Use "DOS". If it doesn't appear your MacOS is not properly installed.
There must be a control panel called "PC Exchange" (up to MacOS 8.1) or
"File Exchange" (MacOS 8.5).

Message-ID: <36635A06.DF3@aquaplan.de>
Source record: 89001

Hello everybody,

I just installed the gcc-2.8.1.c and got trouble with the linker now,
which reports a lot of Symbols defined in more than one modul. But
these are all inline functions frome class definitions and so they
shouldn't be found in the modules. Have I forgotten some compiler
switches or is the linker buggy?
Two switches I found myself: -fno-rtti and -fno-exceptions, to avoid
errors about missing symbols '__rtti' and '___throw'.

Thanks, Ralph

>Hi Dennis
>

One thing I discovered when sending mail with newsie, is when it goes to the editor, and the header comes up (like the above), hit Return a few times befor starting your letter content. For some reason, if you start too close to the header, newsie thinks it is part of it when sending it out. Some of my friends had reported getting the Subject line, but not the content. Some also reported seeing the content in the header! So to advoid this, I always leave a GOOOD space between the header and the content. I don't know if this is exactly your problem, but it could help!

I just bought NVDI 5, and use the Canon BJ200 driver. My problem is that NVDI insists the page size is A4 (8.? x 10.?), and Atariworks (and my other software) is designed for US Letter size (standard 8.5 x 11). This makes it necessary to play with margin settings in all my documents, just so printouts look right. I would like to know how to tell NVDI (or my BJ200) that I live in the USA and am using 8.5 x 11 paper. Any ideas?

Thanks.

Its AVServer support is far superior to Magxdesk's but there are a couple of operational niggles, for example if you have Kobold installed as the file copier it's not easily possible to create an alias with the [ALT] key modifier - Thing should filter this out and bypass Kobold.

If I want to look at the log I just save it to another name when I quit NEWSie, I suspect that if it didn't overwrite the log each time the file would become extremely long! :-))

Well, this might change in the future if everything goes as planned. fVDI will soon have support for Mach64 and also the newer RAGE cards. This would mean that you would be able to go and buy a regular ATI PC card and plug it into your Hades or Falcon (with Eclipse) and get very fast graphics very cheap. fVDI is freeware and will not cost you a dime. If we are lucky we might even see 3D support to give us superiour 3D graphics at a speed you have only dreamed about for TOS compatibles before.

: Now, if my printer *weren't* supported, I'm sure I would feel very
: differently. ;-)

: There obviously exists a printer driver creator for NVDI 5 because these
: drivers were created somehow. Hopefully, 2B will one day choose to make it
: available.

The problem why there us no official NVDI5 printer driver creation tool lies somewhere else. Most of the modern printers do not come with any documentation regarding the ESC Codes etc. for programming drivers. AFAIK the support for modern printers in NVDI5 could only be achieved by the authors by signing a contract not to relaese any information about the driver technolgoy or creation tools.

IMO that's really a stupid move by the printer manufacturers; just like the "Windows only" printers. However, I have also heard that from next year
on, there is an inititiative by many printer manufactureres to develop some kind of "meta-language" that will enable any operating system to find out and support the printer's capabilities using just one intelligent driver.

I guess the easiest solution in to upgrade to the current HDDRIVER.
Current versions support several DOS/TOS compatible partitioning schemes
and you can exchange data between Atari/PC/Mac without having to install
additional software on your Atari.

> one unless it is formatted with a hard disk formatter (ICD Pro) -

I can only refer to the LS-120, which I have connected to my Falcon, but this should be basically the same as with a floptical. With HDDRIVER you can read and write normal floppy disks with the LS-120. I suggest that you simply check if HDDRIVER can read floppy disks also with your floptical. The current demo version of HDDRIVER is on http://acp5.chemie.uni-kl.de/seimet/atari_english.html.

BTW, HDDRIVER now also supports DVD-RAM media.

This disables exceptions and RTTI, very useful features of C++. I
wouldn't want to miss them.
I guess that your linker is too old. Check if you have the current GNU
binutils package installed.

[Alt] ist the modifier to /rename/ files. Use [Left Shift] to create
symbolic links with Thing, and it will then of course not use Kobold.

3771. Printing problem with NVDI/Magic solved

Newsgroup: comp.sys.atari.st
Date: 1998-12-01 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <3663ef9b.0@nemo.idirect.com>
Source record: 89022

just want to leave an update on my problems getting NVDI and MagiC
to print on my Nemesised Falcon in Hi Res TrueColour mode.

Oliver from ASH had e-mailed me and suggested that it might be a
timing or hardware problem, and to try printing from ST High and see
what happened. And, as it turned out, it printed okay in that
resolution - great for black& white documents, but not for printing
anything in colour (like from within CAB).

Well, last night while trying a number of things with my new NVDI 5
upgrade, I called up COPS and decided to use the JAY Software Nemesis
CPX. To my surprise, I discovered that there are two buttons for the
caches (Data and INST) which allow them to switch on and off. So I
tried switching off the caches, then loaded up CAB 2.5 and printed out
a web page.

BINGO! No control characters - and it printed out beautifully. In
fact, perhaps the best quality I've ever seen from the DeskJet 540 since
I bought it (NVDI 5 supports a number of additional options in
TrueColour, including CMYK adjustment). I am really and truly pleased,
and my DeskJet now has a new lease on life.

In fact, I'm sort of wondering if this is the problem that Nemesis
owners have when doing printing in 24/25mHZ mode - just turning off the
caches should probably clear it up. I'm going to have to try that with
Calamus SL next and see what happens.

I did notice that NVDI 5 had some problems with animated GIFs - it
smeared a few of them (I had a number of bullets on a list, and the
first one printed out okay, but the rest - the same bullet - all came
out smeared). The other graphics (including JPEGS and a .GIF) came out
okay....

check the printer .CPX that you got with NVDI 5 - in the options
you should find "paper size", and US letter and legal sizes are there.

Charles

The only one other than AT&T/Sprint/MCI types that comes close to nation wide coverage I can think of is Earthlink. I beleive that in most of these cases they have local dial-up numbers. You could check their web sites, most ISP providers will have a link to coverage area and/or localities they can be accessed from.

Hi Rich! Been working hard at working hard.

I plan to buy MagiC Mac/NVDI soon (before the end of the tax year),
so I might as well add the HD Driver upgrade to the list. All I gotta do now,
is figure out how to PC format the carts so that the mac sees them.

Try manually adding this line into the header of all your emails after
the From: line ...

Return-Receipt-To:<starlord@qnet.com>

This will result in you getting an email confirming delivery to the
destination. It doesn't matter if the recipient has actually
downloaded it or not - just that it has arrived.

Could someone confirm I've got the syntax right? It's been a while
since I used it.

3784. Re: NVDI 5

Newsgroup: comp.sys.atari.st
Date: 1998-12-01 00:00:00 UTC
From: dwmoar <dwmoar@spiritone.com>
Message-ID: <36640D4D.9D756E49@spiritone.com>
Source record: 89035

Why should this matter. I should be able to use any printer that I have or any one that I choose to purchase without someone else telling me which ones that they think I should or that they want to support. It makes a hell of alot more sence to let a user build his own printer driver(s) to suite what he is using or needs to use, than to include a bunch of driver that is not needed. For example I use a Gestetner 3225 multifunctional Printer/scanner/fax/copier (25 copies a minute). Sorry it doesn't use all the HP deskjet technology - why include them? Currently I have to use a Epson or HP lazerII driver, which inhibits the use of the machine (300dpi, no font scaleing, and no duplexing)Put in a few of the basic ones that most of the people use and give the users that don't use them the chance to build their own. Can you tell me which driver(s) support duplex printing with scaleing at 600dpi? I didn't think so! Isn't it kinda of a waste to pay so much money for your system and than not be able to use it as intended?

for what it is worth -

Very interesting, does it give any specifics on how this 640*400*24 was
achieved, ive tried every permutation i can think of and 256 colour is the
best ive got.

3790. NEWSie-Geneva conflict

Newsgroup: comp.sys.atari.st
Date: 1998-12-01 00:00:00 UTC
From: flipflap@coastalnet.com
Message-ID: <OJ_82.396$r32.1736@news15.ispnews.com>
Source record: 89041

My TT running Geneva has a problem with Newsie that started with Newsie88 and is still there with 90 and 92. I usually read newsgroup messages offline. The first time in a session that I delete a message I get the dialog "TOS is attempting to access an invalid drive". I hit return and on the next message I delete it will do the same thing, unless I have a floppy disk in the drive. If there is a disk in the drive, I only get the TOS error message once, on the first message I delete.

This is a minor annoyance and I can live with it. The big problem is, anytime I have deleted a message and then quit Newsie, the next time I use Geneva's Task Manager to start a program I get a major crash. As soon as I select "Open" in the Task Manager's File dropdown I get "fatal error in Geneva: run_acc did not terminate". The computer hangs up and can't be rebooted from the keyboard, only by shutting off the power. I have tested this extensively and it definitely is a conflict with Newsie. If I run with no accessories and without Geneva I still get the "TOS is attempting to access an invalid drive" message, so I know this is a message coming from the Atari OS.

With Geneva installed I can start and quit Newsie repeatedly with no problem until I delete a message. If I have deleted a message, the TT will crash next time I use the Task Manager. The message "fatal error in Geneva: run_acc did not terminate" is obviously coming from Geneva. If I start a program from the desktop I don't get the crash either, only from the Task Manager.

I know other users have the "invalid drive" message, I've not heard anyone else complain about system crashes. Can someone tell me how to configure Geneva-Newsie to avoid this problem?

I only did it because I could :)

Besides, I didn't like Teradesk, it looks awful in mono. Thing didn't have an option to change screen rez, so I use Neodesk as my major Desktop. In fact I believe I have deleted both Teradesk & Thing from my HD.

As for jinnee, can't say that I have had a chance to use it proper, too many menus in German, and I'm not paying for something I don't understand. You never know what damage you could do just by clicking away at menu items.

AM.

I think therefore I AM.

3797. Okami Help Please

Newsgroup: comp.sys.atari.st
Date: 1998-12-02 00:00:00 UTC
From: lockwood@calcna.ab.ca
Message-ID: <744168$tgo@ds2.acs.ucalgary.ca>
Source record: 88895

Well, I've mostly gotten Newswatch/Okami working, but there are still
a couple of problems.

Firstly, when I reply or follow up a mail or post, and quote some of
the previous text, Okami does not insert the right arrows at the start
of each line (>) to indicate what is quoted. Neither does it put in
the introduction string (On %d, %f wrote about %s:) at the start.

Furthermore, despite configuring the O.INF file to point at my
signature file, it never shows up in any of the three options, so I
have to add it manually when I'm editing the text.

Secondly, in order to get messages and newsgroups in and out, I have
to run the .TTP programs OIMPORT and OEXPORT manually - why doesn't
Okami do this from inside the program. Same with OEXPIRE.

Thirdly, there seems to be no easy way to attach a binary file to an
email message. Is my only option to first encode it manually, and
then run Okami, set up to edit a message and then import the MIME or
UUE file into the text editor? For a program that offers such a
quantity of other features, this seems like a strange omission.

Lastly, and most irritating is the following. If I choose to write a
second post or mail during the a run of Okami (that is, without
restarting the program), I lose my mouse cursor in Everest. I've
tried the program, MOUSEON, but that doesn't work. It's very hard to
edit a message, especially when I have to insert the quote and
signature information by hand, without a mouse.

What am I doing wrong?

Thanks,
(the sig that follows was pasted in while writing this message)

Are these PD now? A number of CDs like these have been pulled by their publishers after copyright holders told them how much they wanted in royalties for their copyrighted software to be included on the CD. Tread carefully!

I surely agree. Yann and I are peacefully chatting about the pages.
First I thought to abandon the whole project because I underestimated the
work involved. However now I already have done so much work on it I will
keep working on it. I hope to finish the pages before the end of the
weekend.
So there will be two UTSI's. I hope Yann and I can work something out so
that both versions will have the same info.

Hi!

I have a question.
I have an Atari Falcon computer, actually it's an Atari Crow, which is a Falcon built into a 19" rack with some enhancements in the sound circuits.
Now I would like to use this system as a MIDI controlled sampler. To be more specific: I would like to have a program which can play sound samples and can be controlled by MIDI.
Could someone tell me which program to use and where to get it?
Thanx in ahead!
Please send replies to f.e.j.holleman@student.utwente.nl

Only that once you get the margins set, there shouldn't be much reason to play
with it afterwards. Try something like top 1", bottom .5", left 1" right .5".

Hi Frank,

I see U're using 2.0B.
Find the line in O.INF "quote.txt.file=path to quotefmt.inf"
and next the line "quote.string=>"
Check they're not commented out.
Then check your quotefmt.inf, you should have the following lines active:
*
on %d %f wrote about %s
\end

(I've got on "%d %r wrote:\n" and it works...)
>
>Furthermore, despite configuring the O.INF file to point at my
>signature file, it never shows up in any of the three options, so I
>have to add it manually when I'm editing the text.

First, check the name of SIGS.INF... I had a similar question from someone
over here, who had named the file SIG.INF... it didn't work!

O.INF should have the lines:
sigfile=path to sigs.inf
sig.when=1 (or 2 or 3)

SIGS.INF should at least contain:
*
CU NeXT msg,
\end

and fill in whatever you want between the * and \end. It works here!
>
>Secondly, in order to get messages and newsgroups in and out, I have

Well, that's just the way it is. You can assign simple keys to these
operations.
>

Nope. Hit F9 or F10, then the FIRST thing is click the message menu and
select UUE or MIME. This brings the filesel, select the file and proceed.
Simple as that.
>

Haven't got this problem with QED. Might be an Everest problem, perhaps an
environment problem.
>
>What am I doing wrong?]

You're still learning... :-)

Hi Frank,

Not sure I can help with everything but here goes:

Frank Lockwood <lockwood@calcna.ab.ca> wrote in article
<744168$tgo@ds2.acs.ucalgary.ca>...
> Well, I've mostly gotten Newswatch/Okami working, but there are still
> a couple of problems.
>
> Firstly, when I reply or follow up a mail or post, and quote some of
> the previous text, Okami does not insert the right arrows at the start
> of each line (>) to indicate what is quoted. Neither does it put in
> the introduction string (On %d, %f wrote about %s:) at the start.

Check your O.INF quote configuration settings: the path needs to be correct
which points to QUOTEFMT.INF, also check that you have set quote.binmode=0
to be on the safe side and quote.string=>

> Furthermore, despite configuring the O.INF file to point at my
> signature file, it never shows up in any of the three options, so I
> have to add it manually when I'm editing the text.

Check you have sigs.when set to something other than zero in O.INF.
Assuming it is, check your SIGS.INF to ensure you have a default signature
(ie * in the first line of the section) as the last entry. To start with if
you want different sigs for mail and news it's simplest to have a mail sig
(MAIL.*) followed by default sig (*) for everything else, ie news. You can
get fancier later! Remember that O will use the first sig that matches the
pattern for the group, so the default one must come last.

> Secondly, in order to get messages and newsgroups in and out, I have
> to run the .TTP programs OIMPORT and OEXPORT manually - why doesn't
> Okami do this from inside the program. Same with OEXPIRE.

It does if you want it to: check the Access menu. Note that you can't use
any command line switches if you do it this way (unless this has changed
since 1.34), but you may not want to anyway.

> Thirdly, there seems to be no easy way to attach a binary file to an
> email message. Is my only option to first encode it manually, and
> then run Okami, set up to edit a message and then import the MIME or
> UUE file into the text editor? For a program that offers such a
> quantity of other features, this seems like a strange omission.

When writing a message, click the MIME or UUE button in the write message
dialog and select the file you want to encode. Note that O will only do the
actual encoding when you export the message.

> Lastly, and most irritating is the following. If I choose to write a
> second post or mail during the a run of Okami (that is, without
> restarting the program), I lose my mouse cursor in Everest. I've
> tried the program, MOUSEON, but that doesn't work. It's very hard to

> signature information by hand, without a mouse.

Never had this myself and I always used Everest with Okami. That was with Everest 3.5 and 3.6 with Okami up to 1.34 under MagiC. I guess you could check that Everest can find its .INF file OK. One thing I used to do was have a separate EVEREST.INF in Okami's directory which Everest picked up rather than its normal one in its own directory (make sure you have set the editor's working directory to Okami's directory in O.INF if you want to do this): this let me have different settings for email/news editing than normal (eg no .BAK files etc). This probably won't work if you have set an EVEREST environment variable (see Everest docs).

Hope at least some of the above is helpful.

\end
> quote end

All done. As you see, I have to enter my own quote indicators, so
something is not working.

But I got the sig file to be recognized. This works.
I'll have to poke around in Everest and my Magic.inf file to see that
I haven't enabled some conflict that causes my mouse to disappear on
the second message out from Okami.

> I wrote:
>Secondly, in order to get messages and newsgroups in and out, I have

Well, that's just the way it is. You can assign simple keys to these
operations.
> quote off

All I really had to do was peek under my LED Panel Menu bar clock to
see that there is another menu heading with the commands to import,
export and expire messages - go figure.

So that's two out of four. I still need to get the quoting thing to
work (as it's not working at all at this point), and deal with the
bashful mouse cursor in the second message.

Thanks to all for your help.

Well I've got newsie92 up and running and so far, I read ONE
e-mail message and when I exit the message and deleted it, the
whole system locked up. So I will see if it keeps doing that.
Right now I'm reading and replying offline. But the e-mail will
be the main acid test.

1. to see if I can do e-mail without locking up.

2. to see if I can get the mail out.

and I wish they had not fooled around with changing the grp./inf.
files to lower case, at lest when I go to do something, and UIS
III comes up, newsie has it looking for lower case and I have to
hit * on the menu bar for it to read the upper case letters which
is what they are saved in anyway.

Peter may not be too interested in a NEWSie LOG file. But I had some
problems with STinG and NEWSie way back when...

I thought you were using 0.90 when you had a problem with 0.92. I
think 0.94 will fix your window lockup problem (closing a window twice
on some TOS versions is a no-no).

As for your sync problem, how long does your SMTP server usually take
to establish a connection. It looks like a timeout to me. If your
Maximum Timeout is less than 30 seconds, try increasing it. It may be
that due to the SMTP server connecting slowly, NEWSie is jumping
ahead. (But I would think I would have seen this before now.)

Well I have newsie 92 up and I don't know which is worst, the non-exporting of e-mail in v.88 or the basted v.92 locking up the system after importing e-mail.

I might have to start using antmail for the e-mail and just use newsie for the newsgroups.

Every time I import e-mail, and even if I don't read it, just close the mail box screen, I'll find the whole system is totaly locked up and all I can do is hit reset.

Well I have 92 now, it was e-mailed to me. The incoming mail has
been just fine.

This is what has been happing ...

I fire up STinG and it makes the connection ... I then run
NEWSie from the icon on the Neodesk desktop I use. It runs fine
to that point, I then click on 'GET MAIL', (I have my delay
settings at 60/30), after about 15 to 20 seconds (I've not used
my stop watch to time it yet), it connects and says I have XX
messages and then D/L's them. Now comes thepart I'm hating, even
if I close the mail box right after the D/L or if I read them
1st,(I've tried it both ways) I'll find the system is LOCKED UP,
I can move the mouse pointer around, but NOTHING works, I can't
even shut anything down, so I have to hit the reset button and
start all over again. I re-log on and pull down the Newsgroups,
AND I have found that should I make the mistake of reading just
one message while online, when I close the newsgroup window,
guess what ... yep ... Locked up. This never happened in .88.

If I use newsie to reply to e-mail, I have to do it offline and
just store the messages, as soon as I close the mail window, even
offline, it's lock up city.

I'm starting to think I have to have a set of keys to unlock
everything!

I'm going to ware out the reset button.

Hello All!

This might seem like a silly Q, but..will a 33k(or even a 56K) modem work on my TT, or will a 28K only work as far as the baud rate goes. Right now I am using a 14.4K ..not real fast..but do-able! The only thing is that it is hard to find a 28K modem while 33 and 56 are easy to find.

thanx!

The one problem with print.ttp is that it isn't suitable for printing binary files - not programs but files produced by printing to disk. It seems to strip bytes out and so produces garbage.

So does anyone have a suggestion for a utility that will print such files, preferably via GDOS (to take advantage of NVDI5's background printing), verbatim that can be installed as Thing's printer utility please?

Hi Steve,

well, if you have read the rest, I wrote already it was only possible with some specific software, that came with the card. Software had somehow to access the hardware directly in order to get 24 bit rez. Probably development never went farther, so in the end you can only run 8 bit on the card... At a price of close to DEM 1000 (then) a bit pricey for an 8 bit card, tho' the GFX processor on the card (Inmos G300) should be capable of doing a lot better...

> This might seem like a silly Q, but..
> will a 33k(or even a 56K) modem work on my TT,

Q answers:

An old programming facility that remains from TOS 1.0 only
knows how to report speeds up to 19200.

The cure is to use HS-Modem with Peter Rottengatter's SERIAL.CPX
and it will correctly find the higher baudrates offered on a TT.

Resulting baudrates (over 19200):

Modem2: 34800, 76800, 153600
LAN/s2: 34800, 57600, 115200, 230400

Most modems don't recognize 76800 and 153600 as valid DTE speeds,
unfortunately, which somehow limits Modem2's usefulness.

In that case, buy an RS422 to RS232 cable (available in Mac shops)
and connect your modem through LAN (the baudrates found there are
more typical).

Yes, of course. The only thing you might have to watch out for is compatibility with your ISPs modems at 56k. Eventually they should all be v90 but, in the meantime, there are other (interim) protocols around.

Remember that the DTE (TT to modem) baud rate should be 3 or 4 times the DCE (modem to modem) rate to be able to exploit the in-flight data compression.

On a TT you will be OK with this but may need to go onto Serial 2 to get the 115k2 or above which you will require.

You should also ask around other local users to see what DCE they can manage. A faster modem is no good if the local phone lines are not up to it.

I'll have to try that - if it works, it'll at least be better than
the other solution I ultimately found (shutting of Nemesis' caches via
the JAY Software Nemesis CPX, which I'll also have to register with

I don't see why not - after all, I sometimes share articles I've
written with the XEST newsletter as well.

In fact, I'll e-mail Joe and see if such an article is needed for
#12...

Hi Charles. AFAIK, my ISP does this. They have a 1-800 number that you can use, but they add an extra charge on. I don't remember the number or the extra charge, but you can call 1-800-808-UOFK, and ask for details! ;-)

> Pat

>--
>Pat & Anna
><PATnANNA@ford-trucks.com>
> "Boating, trucking, and loving life. What could be better? :-)"

It does give several choices of page size, but none are user-definable. The page size in the printer CPX, listed as "Letter," comes up as "8x10.38" in the AtariWorks Page Setup menu (when I choose "Set Size to Current Printer), which is not standard US letter (8.5x11).

If I choose "Letter" in the Printer CPX, and "US Letter" in the Page Setup menu, and then try to use a narrow margin (like, say, .10"), I get a warning that "Specified page size exceeds printable area." And, if I use a standard 1" margin, the margins actually measure more than 1", so I have to readjust them in Page Setup so they produce a 1" margin on the printed page. Does anybody know why, or how I can get NVDI and AtariWorks to agree on the correct page size?

This was never a problem under SpeedoGDOS, and has resulted in having to change all the margins on my standard forms (I use this system for contracts, form letters, etc.).

Thanks!

From: "Sheldon H. Winick" <s.winick@worldnet.att.net>
Message-ID: <743jpr$deo@bgtnsc01.worldnet.att.net>
Source record: 88983

For Sale (USA): Dead TTM195 Monitor (USA):

One of my TTM195 monitors just shut down -- the power light no longer comes on. Prior to this power failure, the monitor was working perfectly. This is not an uncommon problem with TTM195's after a few years of service, but since I already have an extra TTM195 (recently sold the TT030 it was attached to), I have no reason to fix this one.

The TTM195 is the 19" high resolution (1280 x 960) monochrome monitor designed for use with Atari's TT030 computer system.

If someone is handy with electronic repairs and would like to tackle the repair (repair parts are available from Best Electronics), you can have the monitor for only $15 plus the cost of shipping (the monitor is large and heavy, so expect UPS shipping charges to run somewhere between $25-$40 depending on distance). Or... if you live somewhere in the Asheville, NC area, you're welcome to pick it up and save the shipping charges.

Please respond in Email to:
s.winick@worldnet.att.net

Eric, the same cable works fine for both Modem 2 and Serial 2. Its a stamdard AT modem cable 9pin/25pin configuration and available from any computer store for around $ 4to $6 (US) for a 2 -3 foot long one.

Tim - Eric is right on the money about using HS Modem. HS Modem corrects a number of problems with the TOS communication routeins and allows for much higher connection rates. If you want to test your phone lines, US Robotics (on their WEB page) has a special number to call using a standard terminal program. After connection a series of data tests are run on your phone line. The program will let you know if your connection will allow 56K access. I tried mine about 4 months ago and it failed. A call to our local phone company (GTE in LA) confirmed that our area would not support speeds higher than around 33K.

Where HS Modem and Serial 2 become important on the TT is when tx compression during transmission comes into play. The normal rule of thumb is to set your internal connection speed at 4X your modems speed. For a 28.8 modem you would use 115.7K as the connection speed in HS Modem. This allows compression to be used on text files.

In general though going to a 56K modem will not generally double your download speed over the net. All it does is increase the speed at which you communicate with your ISP. My experience has been that the connection between me and my ISP is not the bottle neck when on the web:).

Yes, I check them frequently with ICD Cleanup. Occasionaly I find lost
clusters on the drive with Newsie but don't think that is causing this
problem.

>After reading messages, I just deleted everything inside the associated

I save a lot of NG messages and create archives of them. The archiving
program I use cocatenates them into one large textfile and deletes the
individual message files after cocatenating them. For this reason I like
to weed out the messages I don't plan to keep, while I'm reading them.

Today I had an instance when my TT didn't crash after running Newsie, deleting a message, then quitting Newsie and selecting "Open" from Geneva's Task Master. I was amazed to find I was able to start a number of programs via the Task Manager without a system crash. This is typical, right after I ask for help the problem cures itself. Then I tried running a program from the Geneva Manager's "Open" menu, and got the same system lockup I have been getting from the Task Manager's "Open" menu.

I'm wondering if I have something configured wrong in Geneva? If someone has a TT running Geneva and Newsie92 without this problem could you please e-mail your GEM.CNF and GENEVA.CNF files to me?

> wouldn't want to miss them.

I would be happy to be able to use them, but the compiler seems not to
produce code for RTTI and exceptions and the only way I found to solve
this problem was to use these switches.

> I guess that your linker is too old. Check if you have the current GNU
> binutils package installed.

The linker has patch level 41, the newest I think. The problem must be
the
compiler because o-files produced by g++ 2.7.3 where linked correct and
the
destination prg works well. It seems that the compiler ignores inlineing
of member functions and so the linker _have_ to found it in every module
that included such class header files. No I'm searching if this
behaviour is
a genral bug in this version of g++ or if there is a way to force it not
to
ignore the inlineing.

Any ideas?

Ralph

Sorry about that - My comment was based on using Serial 2 and I though that is what you ment as most of the time those connections are referred to as Serial2/Lan.

> The TT defaults to using LAN and most people are don't know how to
> change the sound bit to select Serial2, so LAN is easier to use, and
> if you have anything in your VME slot (many people have a graphics
> card there), then your Serial 2 connector was probably removed.

?????? - Using Peter's Serial CPX, Serial 2, not Lan, is the default. To use the lan port one has to check the box. Now, in an unaltered state TOS 3.** may default to the lan port - but no one is going to be using this set up for accessing the web/internet to begin with. Using HSModem/Serial CPX/Nova card and connected to Serial 2, Serial CPX reports that 230400 are available for both Serial 2 and lan - as does the set-up for HS Modem. If I enable 230400, my 33.6 modem does not see it as a valid rate, so I have to assume that the port speed of Serial 2 has been altered.

Installing a graphics card in my TT and keeping both Serial 1 and 2 active was just a simple matter of taking the ribbon cables and taping them to the bottom of the VME card opening. The Nova card slides in quite happily and does not come in contact with the cables at any point during installation.

The only real downside to all of this is that now the back of my TT is starting to look like a typical PC installation :)

Hi folks,
I just aquired a shrinkwraped brand new copy of Cubase 3.1,
having used Notator for some time thinking it to be at least
somewhat of an 'upgrade' (no flaming please Notator users)
I have to say I've had more problems with Cubase than I ever
had with Notator. Lots of internal errors; I've had problems
with CC data, midi clock syncing, file menu errors, a whole
bunch of stuff actually. What is the deal with this program?
Is it this particular version thats particular buggy? Anyone
else have problems like this, does use of a Midi ouput expander
improve timing and data errors? Please help, I'm running around
in circles here.

thanks in advance,

-H

Sorry, I have insert a bug in size calculation (with news codecs WAV
on this version). In your example, with CTRL-I you can see a double
time.

> PS RealAudio does work! ;-)

Real Audio is limited to old files 14K4. Maybe 28K8 for next version.

Bye,

Didier.

3870. FTP and Telnet for CAB?

Newsgroup: comp.sys.atari.st
Date: 1998-12-03 00:00:00 UTC
From: nameerf@flash.net
Message-ID: <746m5s$cn2$1@excalibur.flash.net>
Source record: 88851

Hello!

I have yet to find a version of FTP (aFTP, Newsie, CAB-FTP, etc) that works correctly as one of CAB's Internet Clients. aFTP seems to at least make the attempt at getting a file listed on a web page, but then says it can't write the file (or something to that effect). Newsie won't automatically download the file passed to it, and you must edit the directory list by hand (which is often impossible if the list is too long). And CAB-FTP just crashes without even trying. Is there a working FTP client for CAB that will download the file you click on from a web page?

I also can't get either Telnet VT102 or TelStar to start up from CAB without crashing. Is there a Telnet client that works with CAB, too?

Thanks!

3871. Ideas (for Falcon developers and CAB)

Newsgroup: comp.sys.atari.st
Date: 1998-12-03 00:00:00 UTC
From: nameerf@flash.net
Message-ID: <746o8egti1@excalibur.flash.net>
Source record: 88852

Hello!

I have some ideas I'd like to bounce off everyone here (especially if the appropriate Hardware/Software developers are watching)...

It's exciting to see all the new Falcon upgrades coming out of Titan and Centek! The CT2 looks pretty nice, and I can't wait for the release of the Tempest to see just how fast it can go! One thing I've been wondering about, however: Even with the MUCH improved speed possible from a 50MHz 68030 (CT2) and a 32/40/50(?)MHz Coldfire 68040 (Tempest), why hasn't anyone tried doing anything with a 68060 for the Falcon? I'm of the opinion that if there is something better available, don't settle for less. In otherwords, the 68030 and 040 are old technology. They've been around since the late 80's and very early 90's. I'd personally love to see my Falcon running at 060 speeds! And I know that there are '060 machines available, but I love my Falcon-only software (Cubase Audio, Running, Moon Games, etc.) and for much of it, there is nothing like it available for the Hades. And I'd like to be able to switch back down to the slower 030 speeds for compatibility with older software as well. Anyone else agree?

Also, I've noticed CAB beginning to fall quite behind in being compatible with many web pages out there. As more and more web sites include Java Script, it becomes increasingly difficult to get to fully make use of them. Why not give CAB the option of using Java Script? I realize that it's very time consuming for slower machines, but what about upgraded Falcons (Afterburner, CT2, and Tempest users) and Milan and Hades machines? Especially with the 060 versions, I'm sure they can handle it! And what if you give CAB the option of having either full Java Script support, a lesser subset of Java Script (the more commonly used items), or none so that people who either have the speed to use it or have the patience to use it (or a subset of it) can have that option?
Another CAB item that I was wondering about was the use of secured sites. Is this possible on CAB? If not, I'd like to see it put in. If it is, I'd like to see some kind of icon or display letting you know if it is or not, like browsers on other platforms do.
Finally, CAB doesn't display the appropriate messages when web sites require you to enter passwords and such. I met this problem with my University's student link web site. Students getting any personal information are required to enter certain information for authentication, some of which is supposed to be given in the window that comes up asking for the entered information. Unfortunately, instead of displaying the information sent from the web site, CAB

displays its own message. This has the unfortunate effect of not allowing me to use the site, because I am not given the information that I must enter to continue.

Oh yeah, one last thing: What happened to the person developing ICQ? A few month ago it was only supposed to be a matter of days...

Yeah it was in the same folder. And yes I tried to run the config
program before using it. My final solution should I say was to
get a friends configuration and place it in the module folder.
After that it all seemed to work fine.

What kind of Atari are you running it on??? How much memory do you have???
An where in the hell did you get a new copy of Cubase???

Typically, some of the "cracked" versions of Cubase had problems but I'm
sure your copy is legit.

I'm running Cubase 3.1 on a Atari TT030, 4Mb, 270Mb HD. I am using the
internal MIDI ports. I just love mine. No crashes.

I too got a new copy of Cubase. All my disks were bad. Are your disks OK?

Regards,
Steve C

p.s. - You did upgrade from Notator to Cubase. everyone can flame me
instead.

>What is the deal with this program? Is it this particular version
>thats particular buggy? .....

Hi,

Sounds like you have a faulty copy, or a hardware problem, as Cubase is usually a thoroughly reliable programme. 3.1 is the most recent "standard" version. (This was followed by Cubase Score which is similar in many respects, but has many more features for scoring the music.)

Are you in the U.K. ? If so you should get technical help from Steinberg. They still support the Atari version in the UK and France. If not, then contact your supplier or mail me direct and I will help if I can.

Cheers

Paul

Haven't tried the latest aFTP, but it used to be OK if the link pointed to
a *file*: it used to get stuck if the link was to a directory. I never had
much luck with Newsie or CAB-FTP but others maybe have.

> I also can't get either Telnet VT102 or TelStar to start up

TVT102 definitely works fine from CAB. However it doesn't understand the AV
protocol so you need to uncheck the VA-start box in CAB's configuration
dialog. You can however run multiple instances of it from CAB, though you
will get minor problems when you quit from instances other than the first,
IIRC.

Javascript is not that slow, it would be useful (as useful as
javascript can be, that is) on standard Falcons as well. The problem
is finding someone with enough skills and time to implement it.

> Another CAB item that I was wondering about was the use of
> secured sites. Is this possible on CAB? If not, I'd like to see it put

SSL is possible if you run MiNTnet and the CAB.OVL for MiNTnet. I use
it all the time without problems.

> Finally, CAB doesn't display the appropriate messages when web
> sites require you to enter passwords and such. I met this problem with

Perhaps this is OVL-dependent, I don't have problems with password
with CAB.OVL for MiNTnet.

Doh! No, really. DOH!!

So let's see here, I've got a sig, I've got quotes, I can import,
export and expire from within the program, I can UUE and MIME, so
what's that leave - oh yeah, I can't seem to get it to import any of
my mail downloaded via Popwatch. It was doing it for a while, but now
I guess I've configured that out somehow. I was trying to set up
several mail folders to automatically handle the various MailLists that
I receive, but now I can't get any mail to be imported (it just says,
"no mail found", even after I know that Popwatch has downloaded some
messages).

And of course the disappearing cursor in the second message out.
Could this have something to do with the data forwarded from Okami to
Everest when I hit "Edit"? (By the way, I tried it with qed and got
the same thing with the added benefit of having qed open two text
windows, one with 00000000.tmp and the other with 00000001.tmp).

So near...

That's right. For example, in this current session I'm having with Okami (just me and the TT here in the gathering darkness just before dinner in little ol' Calgary, 5:10pm with the new Robert Fripp cd playing in the background - hey, people are always asking for more details...), I replied to Gary Priest's post about the quoting thing a minute ago with the full glory of a mouse cursor hanging about there in the window. Now I am writing a second reply, and I'm running blind. Thank goodness for keyboard shortcuts, but God help me if I need to cut and paste anything.

I think I'll re-boot with most of the auto programs off and see what happens.

Thanks to all who have listened to me whine.

Well, I went through all my Auto folder programs and found which one was causing the "disappearing mouse cursor in second outgoing message edit" conflict.

Outburst.

So now I'm wondering whether I really need this after all, since I'm set up to use Magic's FPRN function. I do like having accelerated printing after all... And the Calamus drivers are great.

Perhaps we might get Jos to investigate this conflict....?

Try using POPWatch for the mail fetching and sending. Its able to handle
most of the mails that NEWSie puts out, with the exception of those using
nicknames.

It's also possible to do it later and it's very nice. You can write your
message, then look for the file you want to send, zip it (or use your
favorite packer) or what you want, then attach it (or them !).

Just hit f9 or f10 as well, on the message in the outbound pseudo
folder, and do the same as you describe.

Bye,
/Pascal/

>of each line (>) to indicate what is quoted. Neither does it put in
>the introduction string (On %d, %f wrote about %s:) at the start.

Check the following variables in your O.INF:

```
#quote.text.file=f:\o\quotefmt.inf
quote.text.file=f:\comms\okami\quotefmt.inf
# standard settings:
quote.binmode=1
quote.string=>
```

You have to point your quotefmt.inf.

>Furthermore, despite configuring the O.INF file to point at my
>signature file, it never shows up in any of the three options, so I
>have to add it manually when I'm editing the text.

Set in your O.INF:

```
sig.when=1
```

>Secondly, in order to get messages and newsgroups in and out, I have
>to run the .TTP programs OIMPORT and OEXPORT manually - why doesn't
>Okami do this from inside the program. Same with OEXPIRE.

Okami *HAS* all of this options in menu "Access".

>Thirdly, there seems to be no easy way to attach a binary file to an
>email message.

No problem! Menu: Message -> MIME
(or: Message -> UU)

>Lastly, and most irritating is the following. If I choose to write a
>second post or mail during the a run of Okami (that is, without
>restarting the program), I lose my mouse cursor in Everest.

I have no idea what is the reason. I have been using succesfully
Everest for some time, the same with 1ST Wordplus and Tempus. Now I
changed to QED-451E. All of them worked properly.
Try to change editor - QED works with Okami very well!

Now at the end, a very convenient feature of v. 2.0; set in your O.INF:

globalmsgmask=+n

Have a nice play ;)

->
->Galen (Head YACcer, Yolo Atari Club)

Hi Galen. Its version 2.04, available from the authors website. I've got it to work on samples from my hard disk, but have not tried streaming just yet. It works okay from disk, but if I have a lot of other processes going on (I'm using Mint) it will skip/repeat sometimes.

My biggest problem is that now, v2.04 won't play my .WAV files correctly. It ends .WAV files I've recorded with Alexander Clauses' CD-Player with an "abnormal ending" error. Note that these samples were recorded straight from music CD's at 16-bit/25khz stereo, and take up about 1.2-1.5 megs, + run for about 10 to 15 seconds. Version 2.02 of Aniplay ran these fine. I am hoping he will fix this soon... ;-)

See ya later...

T > Right now I am using a 14.4K ..not real fast..but do-able! The
T > only thing is that it is hard to find a 28K modem while 33 and
T > 56 are easy to find.

The only thing to keep in mind is that, if your phone company is as backward as mine, you are into the area of diminishing returns. When I upgraded from 14.4 to 28.8 I did not get twice the speed - more like a 75% increase. Almost certainly because the phone lines are noisy and low-tech. YMMV. With that in mind, I have not put a faster modem on my list, as I don't expect much of a real increase from here.

Any modern terminal prg should be able to shove a 33.6 or 56k along at full speed - you may have to use hsmoda with it, and you will have to use M2, S1, or S2. Or modify M1.

There was an article somewhere from a modem guru who was testing a Hayes experimental modem with a TT. He was getting _fantastic_ speeds with this setup, but I do not remember details, and it was a while back. Seems to me that he was talking about getting 1M/sec, and actually getting close to 1/10th that. So the port should be up to it.

STalker (okay, I remember - STalker is getting a little long in the tooth :) says that it will push the S2 port along at 230Kb/s - that should be fast enough to prove to anybody that their phone company is pretty medieval.

(rant mode ON)

This may well be the end of wired phones, and maybe it will take the phone co's with it. An outcome devoutly to be wished, and many of us have hoped-without-daring-to-hope for this for many years. The outfit that can offer us digital wireless phones with high speed computer connections will be the wave of the future.

Interesting to hear that. But there was a driver creator in NVDI 4. AIUI
one still had to find out the relevant codes oneself, so I don't
understand why the same could not be done with NVDI 5.

Source record: 88930

Well, myproblems with Okami continue as far as setting up the Quote format.

I've tried everything - I've checked and re-checked O.INF so that quotefmt= points to the correct path to my quote header file. I've made sure that that file's format is correct.

I've even gone so far as to remove all the commented lines from both O.INF and QUOTEFMT.INF - I've reinstalled the ones from the original archive - I even "upgraded" to version 1.35, and all things give me the same thing: The selected quotation (header and/or copy and/or signature) gets put into the new message, but with no leading > in front of each line, and with no "On 12/3/98, Frunobulax wrote:" introduction line. When I check my log file (now set on extra extra debugging mode) all I find is the line, "Quoting text for `comp.sys.atari.st'", plus all the other stuff about adding my signature.

Oh, and my mouse cursor disappears in the second message edited in Everest when writing from BOTH Okami versions.

I'm Stumped.

Other details: stock TT 030, 4 + 4 megs of RAM, Magic 5.11, Thing 1.27, NVDI 4.11r8, and the usual gang of hooligans in the AUTO folder.

Any and all assistance is greatly appreciated.

I used GEMSpooler as a fix for the printing problem until I tried the demo version of iPRN that came on the NVDI5 disk - I've now registered the MagiC XFS variant of this printer port speeder and it functions equally as well.

>Calamus SL next and see what happens.

If you use GEMSpooler or the iPRN speeder then you must select the "Other" button in the printer dialog BTW.

I don't think there is a general bug of this kind. I have been working
on large C++ projects with GNU C++ 2.8.1 since it was released and
didn't have these problems. Note, however, that you can't link C++
object files generated with GNU C++ 2.7.x with GNU C++ 2.8. The formats
are not compatible. Note that this only applies to C++ object files, not
to C object files.

You need Expand from SoftJee. It is a sample player and can run along
with Cubase or be played from the MIDI IN.

http://perso.wanadoo.fr/softjee/

It is commercial, but there is a demo. Version 2.0 will allow recording
of samples, otherwise you need another program to make the samples, like
Zero X or Studio Son.

When I first upgraded to 2.0 from 1.35 I had exactly the same problem as
you. It stumped me for a while and was about to report it as a bug when I
realised it was my fault. When you hit the QUOTE button and are presented
with the little window (copy, with header, with signature). Just click
OKAY. Do *not* select the Copy button. I seem to recall this differs from
1.35 which caused the confusion (in my case anyway). Hopefully? this is the same
problem you are having? The *copy* option is for doing a 'forward as is',
with no quoting etc.

>Oh, and my mouse cursor disappears in the second message edited in
>Everest when writing from BOTH Okami versions.
>
>I'm Stumped.

Never had this before, and I use Everest3.6 with Okami *all* the time.

>Other details: stock TT 030, 4 + 4 megs of RAM, Magic 5.11, Thing
>1.27, NVDI 4.11r8, and the usual gang of hooligans in the AUTO folder.

I'm using a Falcon running MagiC5.11 and Magxdesk, and NVDI4.11r6.

> computer store for around $ 4to $6 (US) for a 2 -3 foot long one.

Notice I _have_ said LAN, not Serial2. It's mini-DIN, not 9-pin.

The TT defaults to using LAN and most people are don't know how to
change the sound bit to select Serial2, so LAN is easier to use, and
if you have anything in your VME slot (many people have a graphics
card there), then your Serial 2 connector was probably removed.

Besides, Serial2 doesn't provide the 230400 baud rate we prefer for
56K modems or ISDN adapters, but LAN requires it for Appletalk.

BTW, it's Martin-Eric. See that hyphen between my firstnames? :)

Modem 1 and Serial 1 both use an MFP that tops off at 19200.
Modem 2 and Serial 2 (LAN) use an SCC that provides 38400 & up.

Just a thought: don't use the option 'Copy' when you wish to quote a
message.

Tip: o.inf don't accept a space at the end of lines. But I wanted to
have a space between the quote sign and the quoted text. So I added a
percent sign:

quote.string=> %

... and it works as you can see :-)

Frank, we are as stumped as you are...

The line
quote.binmode=1 can be commented out. If the other lines are OK, I don't
see why it won't work.

Been thinking of a slightly corrupted program file, but since you already
changed to another version with the same result, I'd rule that one out.

Another wildguess, check the line with
editwd=path to dir where your editor is. So if your editor is in
D:\EVEREST\, the line should read "editwd=d:\everest"
>
>Oh, and my mouse cursor disappears in the second message edited in

>
Well, this is about the same stuff I'm using w/o problems...
You could try with another editor, I tend to believe it's an environment
problem: no quotes, mouse disappearing. Kinda strange, this not happening
in the first msg you're editing... (am I reading you right on mouse-
behaviour?)

hi Frank,

I'm having a similar problem with running NVDI5 when I run
ImageCopy4 - the mouse disappears and the restore mouse program I'd
been using doesn't work anymore.

my solution has been (until I get a newer version of ImageCopy) to
use the BubbleBook desk accessory (the one that was bundled with the ST
Book). Now when the mouse disappears, I just right-click and a caption
bubble appears (like in a cartoon) showing where the cursor is -
usually just enough to finish what I need to do in Imagecopy, quit and
then reboot.

I'm surprised about the TT. It takes a 32 mhz TT eight (8!) times as long
as a 50 mhz 486? Somehow, that just doesn't seem right. Were all tests
set equally among the machines? The TT has a built-in FPU right? (and the
486 chip has it on board, correct?) I'm really curious about this...

I'm surprised about the PII as well...

None of it seems to make any sense... The PII number crunching performance
is very good, and should be a lot faster then a 486DX of any speed. I guess
the TT could take 8 times as long as a 486 if it has no FPU, but with an
FPU the results should be much closer IMO.

Strange...

Regards,

Clockmeister.

Some time ago I was able to DL a replacement graphic for the win95 "logo.sys" and logos.sys screens that pop up when either booting or leaving win95. One looked like the old 8 bit atari basic screen, another was like a gem desktop as I recall.

Anyone know of a site that has these files, I accidently deleted my copies.

Jack

yes indeed, it looks strange but it is true.
I went also looking for 'official' Povray benchmarks for Wind-boxes
and found (in points)

Dec Alpha '11' (they say: wow, so fast!!! and expensive)
PII 450 Mhz '9'
Mendocino 333 '8.5' (the one with 128kb cache and clocked 350 MHz)
WinChip '4'
486 '4'

You see, graphic cards, AGP, ultra DMA, 100 MHz system bus etc. make
things only opartly better.

I was also very surprised. First I thought: do I use a Povray version
on the TT for 68000 CPU without FP? No. I use 68030 FPU instructions.
So how:
First the 486 has an external cache mem of 512 kb. No wait states.
Also the motherboard is faster. What is the mb/sec troughput of the
TT-bus? And how fast goed the bus-clock? Not 32 Meg in the TT.
And how many busclock-cycles for the CPU to do a read? (3) And a
write?
So taking it all in, I think 'could be technically possible...'

A friend of mine used to get the alert "Error while accessing drive u:"
in Geneva. This happened when running Sting's "Serial Ports" and
OEXPORT.TTP. Also when opening the Geneva "Task list" by pressing
[Alternate]+[Shift]+[Control]+[Tab] the alert came up.

He was using AHDI.PRG (SHDRIVER.SYS) version 4 something. Version 6.61
cured the problem. I also found some "directory errors" on his hd that
were not there before in directories he had not been writing to for a
long time. Maybe Sting AND/OR Geneva together with the old hd driver
caused this? He has been running Score Perfect (notation program) for
years with plain TOS 3.6 without disk corruption. Btw. He does
not use Newsie at all.

is it possible to increase the brightness of the screen on the stacy
to make it actually useable without having to draw the curtains in a room?

i would reckon that if you just upped the voltage to the backlight, then
it would burn out rather rapidly. has anyone tried replacing this with
a more powerful/better specified light?

even when the stacy first came out, the screen was a couple of years behind
the times, but other computers weren't all that good, either. but now !...

It could be your modem. Have a look at the specs., Steve.

I have a Zoltrix 28k8 which I wanted to try and run at 230k. After
much messing about I discovered that the highest DTE the modem would
understand is 115k. No real bother if the highest DCE is 28k8, though.

Hi!

I am wondering if anyone out there has an unused copy of
STOS The Game Creator, from Mandarin Software, manual
too. I am in the US, but can pay for overseas.

OR, has something better than that been created?

Now, I've seen the Amiga have something called Games Master System,
which is a wonderfull collection of routines in several langauges,
for gaems. Question, do we Atarians have anything similar?
Or does someone have tons of game routines that they
wouldn't mind sharing?

I own a 1040STf w/megafile 30 and a soon to be Falcon
030 with 14 MB, 720MB HD, a 12x SCSI CD ROM.

ANy help would be most appreciated.

Regards,

Jim W. Krych

Kenneth,

Thanks for the (only) input on my problem. Apparently no one else is
using Geneva with Newsie, or no one else has this problem.

I am using Sting's Serial CPX, but the TT will still crash even without
the CPX. It crashes even with no accessories or auto folder programs
loaded at all. I don't know what the OEXPORT.TTP is.

I'm using ICD Pro for my HD driver, and ICD Cleanup shows no disk problems, but it's the only program I use to check the disk. Maybe there is something it isn't finding. Maybe I should copy everything from my boot and Newsie partitions to another partition and then back again. That should eliminate any unseen direction errors. The only way around this I have found is to do a warm boot immediately after running Newsie. It also seems strange that the problem is not there with Newsie 86, but I get it with all the newer versions.

This is a great game, I'd like to inform you that the author is away at Uni now, but he is still working on the game, and well, the proposed ideas are going to be excellent. If you are running this game from a HD, make sure to change to low res before running, because I believe that 2 colours on the palette are changed and makes something look a little odd, even though it does run perfectly. Oh yeh, this will work with a Veloce, and the new version will be 30% faster on an STe and it does run from Geneva, dunno about MagiC because that's an awkward fu.. well anyway :)

Get it, it's good IMHO :)

I don't think the computer is a problem because I used Notator and it
seemed to run just fine. Also I have a Mega ST2 I ran it on and encountered
a similar sort of thing. Maybe I have a bad disk.

> I too got a new copy of Cubase. All my disks were bad. Are your disks OK?

don't know, thats what I'm trying to find out. Where can I get a legit copy of
the program disks for 3.1?

Oh, there is nothing special about it. It is just like the month begins at the 1st, although the day has just begun, it is the 1st. We are couting the current day which hasn't passed yet, and the year which hasn't passed yet, do you know the function ceil(t)? So when it is the 31st of January it is still January.

There are also some things we people count with the units that have passed. So is it with the time of the day (7 o'clock means that seven hours of the day are behind us) and our age. This is the function floor(t).

I don't know if this applies to all languages.
Sorry for being offtopic, I couldn't resist.

I have decided to sell my TT030. I find that it is not adequate for my needs. I'm planning to get rid of it and get a Falcon. So if you have a Falcon and you want raw power, speed, upgradeability, separate keyboard&CPU, don't care about graphics and sound then let's trade. Make an offer. I myself would like better gfx and sound. Any Falcon will do but I don't have the bucks for a high-end one (centek, nemezis etc). I will also sell it to anyone who needs a TT. It's a basic, early machine...

TOS 3.01
4Mb ST-RAM
1.4Mb disk-drive
50 Mb HD
14.4 Kb modem
ACER SVGA monitor
some software installed...

Magic 6
Thing 2.7
CAB 2.7 english
and lots more commercial applications.

Make an offer. I live in Ontario, Canada.
please pop me either e-mail or answer to the newsgroup.

Hi,

I haven't tried the latest aFTP either yet, but this is in
HISTORY.TXT:

25.10.1998
! fixed downloading files by VA_START (from CAB, i.e.)

so maybe that's worth checking out :-) However, my experience with
aFTP so far has been exactly the opposite - dirs OK, files not :-/

I never had any trouble with CAB-FTP, except sometimes when the ftp
server was responding slowly...

Hi1

I have been running Cubase on my TT with hardly any problems.
Here are some suggestions:
1. Run Cubase without desk acc's
2. It could be the computer...what Atari computer are you using?
You need at least 1M to 4M of ram for cubase to do what it does.
3.Check your Midi Connections...this might seem basic,but could be a
source of problems.
4. It could be your version of Cubase. There is an FTP site where you
can download 3.1. Of course you need the key for it to work. (which
you have!) I don't have the addy handy though. I Think it is on the
stienberg update site.

I don't know if these things will help, but that is my 002C worth!

The TT is the *only* Atari that has real SCSI (considering the dead
slow, not working SCSI-II in the Falcon). It's actually really good,
it's faster than the Falcon's, rock solid and can handle DMA-transfers
to TT-RAM.

Have you seen Smartsofts version of Doom for the ST called Hellgate, I have not tried it myself but if you want to take a look point your web browser at http://ds.dial.pipex.com/town/close/xom85/ to download a demo.

Cubase requires at least 2 megs to run. Get sysinfo.prg from the Quick
FAQ to be sure about your setup.

Hi folks

Does anyone have a copy of Calligrapher Gold that they would like to sell (at reasonable cost) or possibly give away? I've soldiered on with Cal Lite for five years but it's time to move on with something with more than 3 fonts!

Cheers for any help :)
Al Ferrier

3963. Connect manual

Newsgroup: comp.sys.atari.st
Date: 1998-12-04 00:00:00 UTC
From: aprice@postern.demon.co.uk
Message-ID: <912771817.676.6.nnrp-11.9e987258@news.demon.co.uk>
Source record: 88892

Sonmeone mentioned recently that CoNnect was now PD, but that the manual may be available in the UK from Sytems Solutions. It is, but the cost- 29.95ukp plus VAT and P&P- appears to be the same as the full commercial system, and the CoNnect system disk is included.

The invoice specifically mentions "CoNnect- the Comms Book".

David,

as someone else told you already, if you want a DECENT SCSI-bus, you need
a TT, definitely not a Falcon. As with lots of Falcon hardware, it was
only half implemented. Graphics on the Falcon? Any TT with a decent card
will do better than the Falcon. OK, it's got a DSP, so if you're gonna use
programs that use it a lot, you're better off with a Falcon.
How about memory expansion on a Falcon? Still limited to 14 megs? Just a
laugh, nowadays.
Another TT-bonus is the old ACSI bus, together with the SCSI. Falcon's
don't have this one either.

Well, before others are offended, I'll stop here, but as I've said before,
in my eyes the Falcon's not even worth being considered as an alternative.

Just my 2 Euro-cents...

A few years ago when I bought my modem from System Solutions I asked for the best terminal program they had. They recommended CoNnect and told me that it cost £30 (or thereabouts). It was only when I received it that I found it was shareware and not commercial and that it did not suit my purpose. (I use STalker instead.)

Depends if you're using a PCI, VLB or ISA or EISA based mainboard that
contains the 486 as well as its clock speed (in case of ISA and EISA, 8MHz,
VLB at CPU speed and PCI at 33 or 66MHz). The PC also has a dedicated
graphics card.

<<snipped>> I'm surprised about the TT. It takes a 32 mhz TT eight (8!) times as long
> as a 50 mhz 486? Somehow, that just doesn't seem right. Were all tests

Actually, it does. Like I said before, the 030 with 68882 in the TT should be compared to a 386, not a 486. Although I'd place it somewhere in between the 386DX and the 486SX.

> set equally among the machines? The TT has a built-in FPU right? (and the
> 486 chip has it on board, correct?) I'm really curious about this...

You should compare the 486 varieties to its 040 equals.

David, don't look on WWW sites (unless you know of one where you can find
things, but usually you find only stuff from certain programmers).

This is the FTP business: go look on any site, you'll find tons of utils.

ftp.uni-paderborn.de dir /atari
ftp.funet.fi dir /pub/atari
ftp.atari.archive.umich.edu dir /atari (mainly old stuff)

to name BUT a few....

Go exploring and use Hallvard's monthly update on sites!
